April 10 Math 3260 sec. 55 Spring 2018

Section 6.2: Orthogonal Sets

Definition: An orthogonal basis for a subspace W of \mathbb{R}^n is a basis that is also an orthogonal set.

Theorem: Let $\{\mathbf{u}_1, \ldots, \mathbf{u}_p\}$ be an orthogonal basis for a subspace W of \mathbb{R}^n . Then each vector **y** in W can be written as the linear combination

> $\mathbf{y} = c_1 \mathbf{u}_1 + c_2 \mathbf{u}_2 + \cdots + c_p \mathbf{u}_p,$ where the weights

$$c_j = rac{\mathbf{y} \cdot \mathbf{u}_j}{\mathbf{u}_j \cdot \mathbf{u}_j}$$

April 10, 2018

1/59

Projection

Given a nonzero vector **u**, suppose we wish to decompose another nonzero vector **y** into a sum of the form

$$\mathbf{y} = \hat{\mathbf{y}} + \mathbf{z}$$

in such a way that \hat{y} is parallel to **u** and **z** is perpendicular to **u**.

Projection onto the subspace $L = \text{Span}\{\mathbf{u}\}$

Notation:
$$\hat{\mathbf{y}} = \text{proj}_L \mathbf{y} = \left(\frac{\mathbf{y} \cdot \mathbf{u}}{\mathbf{u} \cdot \mathbf{u}}\right) \mathbf{u}$$

The distance between **y** and *L* is the norm $||\mathbf{y} - \text{proj}_L||$.

Orthonormal Sets

Definition: A set $\{u_1, \ldots, u_p\}$ is called an **orthonormal set** if it is an orthogonal set of **unit vectors**.

Definition: An **orthonormal basis** of a subspace W of \mathbb{R}^n is a basis that is also an orthonormal set.

Example: Show that
$$\left\{ \begin{bmatrix} \frac{3}{5} \\ \frac{4}{5} \end{bmatrix}, \begin{bmatrix} -\frac{4}{5} \\ \frac{3}{5} \end{bmatrix} \right\}$$
 is an orthonormal basis for
 \mathbb{R}^2 .
To show this is a basis, note det $\begin{bmatrix} \frac{3}{5} & \frac{1}{5} \\ \frac{3}{5} & \frac{3}{5} \end{bmatrix} = \frac{4}{25} + \frac{16}{25} = 1 \neq 0$
The clumns are lin. independent and spen \mathbb{R}^2 .
(Invertible notive theorem)
April 10, 2018 4/59

To see that it's orthonormal, note

$$\vec{u}_1 \cdot \vec{u}_1 = \left(\frac{3}{5}\right)^2 + \left(\frac{4}{5}\right)^2 = \frac{25}{25} = 1 \implies ||\vec{u}_1|| = \sqrt{1} = 1$$

 $\vec{u}_1 \cdot \vec{u}_2 = \frac{3}{5}\left(\frac{4}{5}\right) + \frac{4}{5}\left(\frac{3}{5}\right) = 0$
 $\vec{u}_2 \cdot \vec{u}_2 = \left(-\frac{4}{5}\right)^2 + \left(\frac{3}{5}\right)^2 = \frac{25}{25} = 1 \implies ||\vec{u}_2|| = \sqrt{1} = 1$
They are orthogonal unit vectors, so
we have an orthonormal basis for \mathbb{R}^2 .

Orthogonal Matrix

Consider the matrix $U = \begin{bmatrix} \frac{3}{5} & -\frac{4}{5} \\ \frac{4}{5} & \frac{3}{5} \end{bmatrix}$ whose columns are the vectors in the last example. Compute the product

$$U^{T}U : \begin{bmatrix} \frac{3}{3} & \frac{4}{5} \\ \frac{1}{5} & \frac{3}{5} \end{bmatrix} \begin{bmatrix} \frac{3}{5} & \frac{4}{5} \\ \frac{4}{5} & \frac{3}{5} \end{bmatrix} = \begin{bmatrix} (\frac{3}{5})^{1} + (\frac{4}{5})^{2} & \frac{12}{55} + \frac{12}{55} \\ \frac{12}{25} + \frac{12}{25} & (\frac{4}{5})^{2} + (\frac{3}{5})^{2} \end{bmatrix}$$
$$= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$
What does this say about U^{-1} ?
It must be that $U^{-1} : U^{T}$

April 10, 2018 6 / 59

Orthogonal Matrix

Definition: A square matrix U is called an **orthogonal matrix** if $U^{T} = U^{-1}$.

Theorem: An $n \times n$ matrix U is orthogonal if and only if it's columns form an orthonormal basis of \mathbb{R}^n .

April 10, 2018

7/59

The linear transformation associated to an orthogonal matrix preserves *lenghts* and *angles* in the following sense:

Theorem: Orthogonal Matrices

Let *U* be an $n \times n$ orthogonal matrix and **x** and **y** vectors in \mathbb{R}^n . Then (a) $||U\mathbf{x}|| = ||\mathbf{x}||$

(b)
$$(U\mathbf{x}) \cdot (U\mathbf{y}) = \mathbf{x} \cdot \mathbf{y}$$
, in particular

(c)
$$(U\mathbf{x}) \cdot (U\mathbf{y}) = 0$$
 if and only if $\mathbf{x} \cdot \mathbf{y} = 0$.
Proof (of (a)):

Recall
$$\|\vec{x}\|^2 = \vec{x} \cdot \vec{x}$$

 $\vec{x} \cdot \vec{x} = \vec{x}^T \vec{x}$
and $(U\vec{x})^T = \vec{x}^T U^T$

イロト 不得 トイヨト イヨト 二日

Note that $\| \mathbf{u} \mathbf{x} \|^{2} = \left(\mathbf{u} \mathbf{x} \right)^{T} \left(\mathbf{u} \mathbf{x} \right)$ · x U U X $= \vec{x}^{T} (u^{T} u) \vec{x}$ = v T v $= \vec{\mathbf{x}}^{\mathsf{T}} \vec{\mathbf{x}}$ $= \|\vec{x}\|^{2}$

Since IIhxIII and IIXIII are nonnegative, we on take the square root to get

|| U x || = || X || .

Section 6.3: Orthogonal Projections

Equating points with position vectors, we may wish to find the point $\hat{\mathbf{y}}$ in a subspace *W* of \mathbb{R}^n that is *closest* to a given point \mathbf{y} .

Figure: Illustration of an orthogonal projection. Note that $dist(\mathbf{y}, \hat{\mathbf{y}})$ is the shortest distance between \mathbf{y} and the points on W.

April 10, 2018 11 / 59

Orthogonal Decomposition Theorem

Let *W* be a subspace of \mathbb{R}^n . Each vector **y** in \mathbb{R}^n can be written uniquely as a sum

$$\mathbf{y} = \hat{\mathbf{y}} + \mathbf{z}$$

where $\hat{\mathbf{y}}$ is in W and \mathbf{z} is in W^{\perp} .

If $\{\mathbf{u}_1, \ldots, \mathbf{u}_p\}$ is any orthogonal basis for W, then

$$\hat{\mathbf{y}} = \sum_{j=1}^{p} \left(\frac{\mathbf{y} \cdot \mathbf{u}_j}{\mathbf{u}_j \cdot \mathbf{u}_j} \right) \mathbf{u}_j, \text{ and } \mathbf{z} = \mathbf{y} - \hat{\mathbf{y}}.$$

Remark: Note that the basis must be orthogonal, but otherwise the vector $\hat{\mathbf{y}}$ is **independent** of the particular basis used!

Remark: The vector $\hat{\mathbf{y}}$ is called the **orthogonal projection of y onto** *W*. We can denote it

proj_W **y**.

Computing Orthogonal Projections

Theorem: If $\{\mathbf{u}_1, \dots, \mathbf{u}_p\}$ is an orthonormal basis of a subspace W of \mathbb{R}^n , and \mathbf{y} is any vector in \mathbb{R}^n then

$$\mathbf{\hat{v}}_{\mathbf{y}}$$
 = proj_W $\mathbf{y} = \sum_{j=1}^{p} (\mathbf{y} \cdot \mathbf{u}_j) \mathbf{u}_j.$

And, if *U* is the matrix $U = [\mathbf{u}_1 \cdots \mathbf{u}_p]$, then the above is equivalent to

$$\mathsf{proj}_{W} \, \mathbf{y} = U U' \, \mathbf{y}$$

Remark: In general, *U* is not square; it's $n \times p$. So even though UU^T will be a square matrix, it is not the same matrix as U^TU and it is not the identity matrix.

Example

$$W = \operatorname{Span} \left\{ \left[\begin{array}{c} 2\\1\\2 \end{array} \right], \left[\begin{array}{c} -2\\2\\1 \end{array} \right] \right\}$$

Find an orthonormal basis $\{\vec{v}_1, \vec{v}_2\}$ for *W*. Then compute the matrices $U^T U$ and UU^T where $U = [\vec{v}_1 \ \vec{v}_2]$.

April 10, 2018 18 / 59

$$\begin{bmatrix}
 U &= \frac{1}{3}
 \begin{bmatrix}
 z & 1 & 2\\
 -2 & 2 & 1
 \end{bmatrix}
 \begin{bmatrix}
 z & -2\\
 1 & 2\\
 z & 1
 \end{bmatrix}
 = \frac{1}{9}
 \begin{bmatrix}
 P & 0\\
 0 & q
 \end{bmatrix}
 = \begin{bmatrix}
 1 & 0\\
 0 & 1
 \end{bmatrix}$$

$$UU^{T} : \frac{1}{3} \begin{bmatrix} 2 & -2 \\ 1 & 2 \\ 2 & 1 \end{bmatrix} + \begin{bmatrix} 2 & 1 & 2 \\ -2 & 2 & 1 \end{bmatrix} = \frac{1}{9} \begin{bmatrix} 8 & -2 & 2 \\ -2 & 5 & 4 \\ 2 & 4 & 5 \end{bmatrix}$$

April 10, 2018 19 / 59
