Section 16: Laplace Transforms of Derivatives and IVPs

If
$$\mathcal{L}\{f(t)\} = F(s)$$
, we have $\mathcal{L}\{f'(t)\} = sF(s) - f(0)$.

Extending this

$$\mathcal{L}\{f''(t)\} = s\mathcal{L}\{f'(t)\} - f'(0)$$

$$= s(sF(s) - f(0)) - f'(0)$$

$$= s^2F(s) - sf(0) - f'(0)$$

Similarly
$$\mathcal{L}\{f'''(t)\} = s^3 F(s) - s^2 f(0) - sf'(0) - f''(0)$$
.

Transforms of Derivatives

For y = y(t) defined on $[0, \infty)$ having derivatives y', y'' and so forth, if

$$\mathscr{L}\left\{y(t)\right\}=Y(s),$$

then

$$\mathscr{L}\left\{\frac{dy}{dt}\right\} = sY(s) - y(0),$$

$$\mathscr{L}\left\{\frac{d^2y}{dt^2}\right\} = s^2Y(s) - sy(0) - y'(0),$$

÷

$$\mathscr{L}\left\{\frac{d^{n}y}{dt^{n}}\right\} = s^{n}Y(s) - s^{n-1}y(0) - s^{n-2}y'(0) - \cdots - y^{(n-1)}(0).$$

Differential Equation

For constants a, b, and c, take the Laplace transform of both sides of the equation

$$ay'' + by' + cy = g(t), \quad y(0) = y_0, \quad y'(0) = y_1$$
Let $\mathcal{L}\{y(t)\} = \mathcal{L}(s) \quad \text{and} \quad \mathcal{L}\{g(t)\} = \mathcal{G}(s)$

$$\mathcal{L}\{ay'' + by' + cy\} = \mathcal{L}\{g(t)\}$$

$$\mathcal{L}\{y''\} + \mathcal{L}\{y'\} + \mathcal{L}\{y'\} + \mathcal{L}\{y\} = \mathcal{L}\{g(t)\}$$

$$\mathcal{L}\{y''\} + \mathcal{L}\{y'\} + \mathcal{L}\{y'\} + \mathcal{L}\{y\} = \mathcal{L}\{g(t)\}$$

$$\mathcal{L}\{y''\} + \mathcal{L}\{y'\} + \mathcal{L}\{y'\} + \mathcal{L}\{y\} = \mathcal{L}\{g(t)\}$$

$$as^{2}Y(s) - asylon - ay'(o) + bs Y(s) - by(o) + cY(s) = G(s)$$

$$(as^{2} + bs + c) Y(s) - asylon - ay'(o) - by(o) = G(s)$$

$$(as^{2} + bs + c) Y(s) - ay_{o}s - ay_{i} - by_{o} = G(s)$$

$$(as^{2} + bs + c) Y(s) = ay_{o}s + ay_{i} + by_{o} + G(s)$$

$$(as^{2} + bs + c) Y(s) = ay_{o}s + ay_{i} + by_{o} + G(s)$$

$$Y(s) = ay_{o}s + ay_{i} + by_{o} + G(s)$$

This is the Loplace transform of the Solution y(t) to the IVP. To solve the NP towe the inverse transform y (+)= y (405)

Solving IVPs

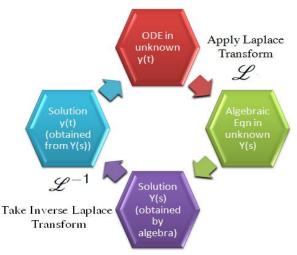

Figure: We use the Laplace transform to turn our DE into an algebraic equation. Solve this transformed equation, and then transform back.

General Form

We get

$$Y(s) = \frac{Q(s)}{P(s)} + \frac{G(s)}{P(s)}$$

where Q is a polynomial with coefficients determined by the initial conditions, G is the Laplace transform of g(t) and P is the **characteristic polynomial** of the original equation.

$$\mathscr{L}^{-1}\left\{\frac{Q(s)}{P(s)}\right\}$$
 is called the **zero input response**,

and

$$\mathscr{L}^{-1}\left\{\frac{G(s)}{P(s)}\right\}$$
 is called the **zero state response**.

Solve the IVP using the Laplace Transform

(a)
$$\frac{dy}{dt} + 3y = 2t \quad y(0) = 2$$

$$2\left\{\frac{dy}{dt} + 3y\right\} = 2\left\{2t\right\}$$

$$(S+3)Y(s)-2=\frac{2}{s^3} \Rightarrow (S+3)Y(s)=\frac{2}{s^2}+2$$

$$Y(s) = \frac{2}{s^2(s+3)} + \frac{2}{s+3}$$

we mid y'{yos}. Do partial fraction decomp on the first term.

$$S^{2}(s+3) = \frac{A}{S^{2}} + \frac{B}{S^{2}} + \frac{C}{S+3}$$

$$2 = A S(s+3) + B(s+3) + Cs^{2}$$

$$= A(s^{2}+3s) + B(s+3) + Cs^{2}$$

$$3A + G = 0$$
 $\Rightarrow A = \frac{1}{3}B$ $\Rightarrow A = \frac{1}{3} \cdot \frac{2}{3} = \frac{2}{5} \cdot \frac{2}{5} = \frac{2}{5} = \frac{2}{5} \cdot \frac{2}{5} = \frac{2}{5}$

$$Y(s) = \frac{-2lq}{s} + \frac{2l3}{s^2} + \frac{2lq}{s+3} + \frac{2}{s+3}$$

$$2 + \frac{2}{9} = \frac{20}{9}$$

$$Y(s) = \frac{-2lq}{s} + \frac{2l_3}{s^2} + \frac{20lq}{s+3}$$

1000 J (700)

$$y(k) = y^{-1} \left\{ \frac{-2/q}{s} + \frac{2/3}{s^2} + \frac{20/q}{s+3} \right\}$$

Solve the IVP using the Laplace Transform

$$y'' + 4y' + 4y = te^{-2t} \quad y(0) = 1, y'(0) = 0$$

$$(S^2+4S+4)Y(S) = \frac{1}{(S+2)^2} + S+4$$

$$Y(s) = \frac{1}{(s+2)^2(s^2+4s+4)} + \frac{s+4}{s^2+4s+4}$$

$$= \frac{1}{(s+2)^4} + \frac{s+2}{(s+2)^2} + \frac{2}{(s+2)^2}$$

$$Y(s) = \frac{1}{(s+2)^4} + \frac{1}{s+2} + \frac{2}{(s+2)^2}$$

Note:
$$y\{t^3\} = \frac{3!}{5!} \Rightarrow \frac{1}{5!} y\{t^3\}$$

 $= y\{\frac{1}{3!}t^3\}$
 $= y\{\frac{1}{3!}t^3\}$
 $= y\{\frac{1}{3!}t^3\}$
 $= y\{\frac{1}{3!}t^3\}$

April 20, 2016 15 / 29

$$y(t) = y^{-1} \left\{ \frac{1}{(s+2)^4} \right\} + y^{-1} \left\{ \frac{1}{s+2} \right\} + z y^{-1} \left\{ \frac{1}{(s+2)^2} \right\}$$

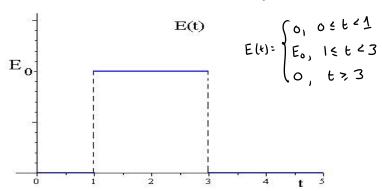

$$= \frac{1}{3!} t^3 e^{-2t} + e^{-2t} + z t e^{-2t}$$

$$= \frac{1}{3!} t^3 e^{-2t} + e^{-2t} + z t e^{-2t}$$

$$= \frac{1}{3!} t^3 e^{-2t} + e^{-2t} + z t e^{-2t}$$

Solve the IVP

An LR-series circuit has inductance L = 1h, resistance $R = 10\Omega$, and applied force E(t) whose graph is given below. If the initial current i(0) = 0, find the current i(t) in the circuit.

LR Circuit Example

$$E = \begin{cases} 0, & 0 \le t \ge 1 \\ 0, & t > 3 \end{cases}$$

$$= 0 - 0U(t-1) + E_0U(t-1) - E_0U(t-3) + 0U(t-3)$$

$$= E_0U(t-1) - E_0U(t-3)$$

Well finish this after Tuesday's exon.
