Section 7: Reduction of Order

We'll focus on second order, linear, homogeneous equations. Recall that such an equation has the form

$$a_2(x)\frac{d^2y}{dx^2} + a_1(x)\frac{dy}{dx} + a_0(x)y = 0.$$

Let us assume that $a_2(x) \neq 0$ on the interval of interest. We will write our equation in **standard form**

$$\frac{d^2y}{dx^2} + P(x)\frac{dy}{dx} + Q(x)y = 0$$

A D N A B N A B N A B N

where $P = a_1/a_2$ and $Q = a_0/a_2$.

$$\frac{d^2y}{dx^2} + P(x)\frac{dy}{dx} + Q(x)y = 0$$

Recall that every fundmantal solution set will consist of two linearly independent solutions y_1 and y_2 , and the general solution will have the form

$$y = c_1 y_1(x) + c_2 y_2(x).$$

Suppose we happen to know one solution $y_1(x)$. **Reduction of order** is a method for finding a second linearly independent solution $y_2(x)$ that starts with the assumption that $y_2(x) = y_2(x)$

$$y_2(x) = u(x)y_1(x)$$
 due to linear independence

for some function u(x). The method involves finding the function u.

Generalization

Consider the equation **in standard form** with one known solution. Determine a second linearly independent solution.

$$\frac{d^2y}{dx^2} + P(x)\frac{dy}{dx} + Q(x)y = 0, \quad y_1(x) - -is \text{ known.}$$

Since b_1 , solves the ODE, we know that
 $y_1'' + P(x)y_1' + Q(x)y_1 = 0$
Assume $y_2 = u(x)y_1(x)$ Substitute
 $y_2' = u'y_1 + uy_1'$
 $y_2'' = u'y_1 + uy_1' + uy_1' + uy_1''$
 $= u'y_1 + 2u'y_1' + uy_1'' + uy_1''$
February 15, 2019 8/38

$$\frac{y_{z}'' + P(x)y_{z}' + Q(x)y_{z}}{y_{z}} = 0$$

$$\frac{u''y_{1} + zu'y_{1}' + uy_{1}'' + P(x)(u'y_{1} + uy_{1}') + Q(x)uy_{1}}{z} = 0$$
Collect u'', u', and u terms
$$u''y_{1} + (ay_{1}' + P(x)y_{1})u' + (y_{1}'' + P(x)y_{1}' + Q(x)y_{1})u = 0$$

$$\underbrace{u''y_{1}}_{0'y_{1}} = 0$$

 $u''y_{1} + (2y_{1}' + P(x_{1}y_{1}))u' = 0$

◆□> ◆圖> ◆理> ◆理> 三連

let w= u' then w'= u". The equation for w is 1st order linear and separable

$$y_{1}, w' + (zy_{1}' + P(x)y_{1}) w = 0$$

Let's suppose W>O and separate the variables

$$y_1 \frac{dW}{dx} = -(2 \frac{dy_1}{dx} + P(x)y_1)W$$

$$\frac{1}{w} \frac{dw}{dx} = -\frac{1}{y_1} \left(2 \frac{dy_1}{dx} + P(x)y_1 \right)$$

 $\int \frac{1}{w} dw = \int \frac{-1}{y_1} \left(2 \frac{dy_1}{dx} + P(x) y_1 \right) dx$

February 15, 2019 10 / 39

$$\int \frac{1}{\sqrt{2}} dW = \int \frac{-2}{9i} \frac{dy_i}{dx} dx - \int P(x) dx$$

$$\int \frac{1}{\sqrt{2}} dW = \int -2 \frac{dy_i}{9i} - \int P(x) dx$$

$$\int nW = -2 \int n|y_i| - \int P(x) dx$$

$$W = e^{\ln 9i} - \int P(x) dx$$

$$= \frac{9i}{9i} e^{-\int P(x) dx}$$

$$= \frac{-\int P(x) dx}{(y_i)^2}$$

February 15, 2019 11 / 39

$$u = \int \frac{-\int P(x) dx}{(y_1)^2} dx$$

Reduction of Order Formula

For the second order, homogeneous equation in standard form with one known solution y_1 , a second linearly independent solution y_2 is given by

$$y_2 = y_1(x) \int \frac{e^{-\int P(x) \, dx}}{(y_1(x))^2} \, dx$$

Example

Find the general solution of the ODE given one known solution

$$x^{2}y'' - 3xy' + 4y = 0, \quad y_{1} = x^{2}$$

Standard form $y'' - \frac{3}{x}y' + \frac{y}{x^{2}}y = 0$

$$P(x) = -\frac{3}{x} \qquad y_{2} = uy_{1} \quad \text{where}$$

$$u = \int \frac{-\int P(x) dx}{(y_{1})^{2}} dx$$

$$e^{-\int P(x) dx} = e^{-\int \frac{-3}{x} dx} = e^{\int \frac{3}{x} dx} = \frac{3h_{1} |x|}{(y_{1} + y_{2})^{2}} = \frac{1}{2} |x|$$

$$e^{-\int P(x) dx} = e^{-\int \frac{-3}{x} dx} = e^{-\int \frac{-3}{x} dx} = e^{-\int \frac{3}{x} dx} = \frac{3h_{1} |x|}{(y_{1} + y_{2})^{2}} = \frac{1}{2} |x|$$

let's assume x>0. Then 1×1 = x

$$u = \int \frac{x^3}{(x^2)^2} dx = \int \frac{x^3}{x^4} dx = \int \frac{1}{x} dx = \ln x$$

We can take the constant of integration to be anything at this intermediate step. We'll take it to be zero.

$$y_2 = uy_1 = (lnx)x^2 = x^2 lnx$$

The general solution is $y = C_1x^2 + C_2x^2 lnx$
($u > (low local definition of the second definition of the$

Section 8: Homogeneous Equations with Constant Coefficients

We consider a second order, linear, homogeneous equation with constant coefficients

$$a\frac{d^2y}{dx^2} + b\frac{dy}{dx} + cy = 0.$$

February 15, 2019

22/39

Question: What sort of function y could be expected to satisfy

$$y'' = \text{constant } y' + \text{constant } y?$$

We look for solutions of the form $y = e^{mx}$ with m constant. Substitute into ay"+ by + cy = 0 y=e y'= menx y"= m2emx $a(m^2 e^{mx}) + b(m e^{mx}) + C(e^{nx}) = 0$ $\mathcal{C}^{\text{mx}}(am^2 + bm + C) = 0$

This is true if m is a root of the

February 15, 2019 23 / 39

guadretic
$$am^{2}+bm + C$$
.
So $y = e^{mx}$ is a solution provided
 $am^{2}+bm + C = 0$
 $am^{2}+bm + C$ is alled the characteristic
polynomial for $ay'' + by' + Cy = 0$ as
 $am^{2}+bm + C = 0$ is the characteristic
equation.

Auxiliary a.k.a. Characteristic Equation

$$am^2 + bm + c = 0$$

There are three cases:

- $b^2 4ac > 0$ and there are two distinct real roots $m_1 \neq m_2$
- II $b^2 4ac = 0$ and there is one repeated real root $m_1 = m_2 = m_1$
- III $b^2 4ac < 0$ and there are two roots that are complex conjugates $m_{1,2} = \alpha \pm i\beta$

February 15, 2019

25/39

Case I: Two distinct real roots

$$ay'' + by' + cy = 0$$
, where $b^2 - 4ac > 0$
 $y = c_1 e^{m_1 x} + c_2 e^{m_2 x}$ where $m_{1,2} = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$

Show that $y_1 = e^{m_1 x}$ and $y_2 = e^{m_2 x}$ are linearly independent.

Le con use the Wronskian

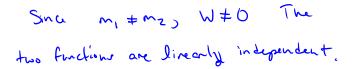

$$W(y_1, y_2)(x) = \begin{vmatrix} y_1 & y_2 \\ y_1' & y_2' \end{vmatrix} = \begin{vmatrix} m_1 x & m_2 x \\ m_1 e & m_2 e \end{vmatrix}$$

$$= M_2 \mathcal{C} \mathcal{C} \mathcal{C} - M_1 \mathcal{C} \mathcal{C} \mathcal{C}$$

$$= (m_2 - m_1) e^{(m_1 + m_2) \times}$$

$$(m_1 + m_2) \times$$

$$W = (m_2 - m_1) e^{(m_1 + m_2) \times}$$
