Section 5.2: Volumes

Solid Formed by Revolution

Consider a region bounded under the nonnegative function y = f(x) for $a \le x \le b$. If this region is rotated about the *x*-axis, a solid is formed. The cross sections of this solid will be circles with radius f(x). So the volume of such a solid is

Solid of Revolution:
$$V = \int_a^b \pi(f(x))^2 dx$$

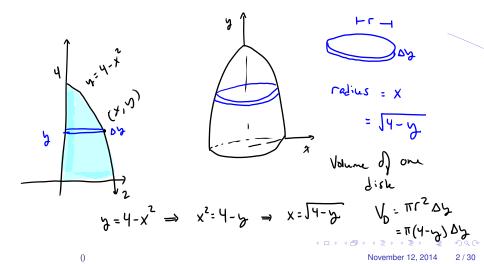

This is called the method of **disks**. Each very thin slice is a disk.

We can construct a similar integral for the volume of a solid of revolution for which the axis of rotation is some other horizontal or vertical line (i.e. not the *x*-axis)

The first quadrant region bounded between $y = 4 - x^2$ and the x and y axes is rotated about the y-axis. Find the volume of the resulting solid.

The total Volume

$$J = \int_{0}^{4} \pi (4 - y) dy$$

$$= \pi \int_{0}^{4} (4 - y) dy$$

$$= \pi \left[4y - \frac{y^{2}}{2} \right]_{0}^{4}$$

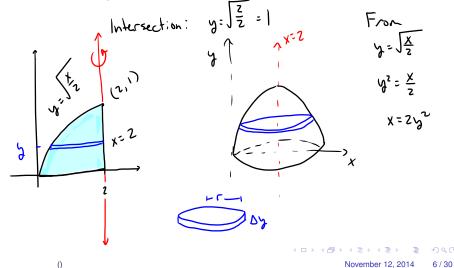

$$= \pi \left[4y - \frac{y^{2}}{2} - (4 \cdot 0 - \frac{0^{2}}{2}) \right]$$

The region bounded by the curves $y = \sqrt{\frac{x}{2}}$, y = 0, and x = 2 is rotated about the line x = 2. Find the volume of the resulting solid.

radius $r = 2 - X = 2 - 2y^{2}$ ana is $\pi r^{2} = \pi (2 - 2y^{2})^{2}$

The total volume is

$$V = \int_{0}^{1} \pi (2 - 2y^{2})^{2} dy$$

Washers: (solid with a solid part removed)

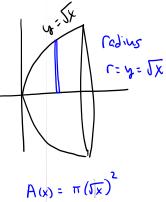

Suppose we consider the region bounded between two curves y = f(x) and y = g(x) for $a \le x \le b$ with $0 \le g(x) \le f(x)$. If this region is rotated about the *x*-axis, a solid is generated with volume

$$V = \int_{a}^{b} \pi((f(x))^{2} - (g(x))^{2}) \, dx$$

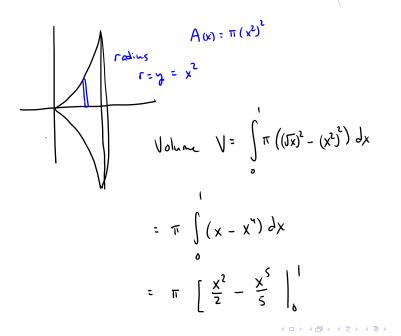

This is called the method of **washers**. Each very thin slice is shaped like a washer (a disk with a concentric disk removed).

Find the volume of the solid obtained by rotating the region bounded between $y = \sqrt{x}$ and $y = x^2$ about the *x*-axis.

Volume by Washers Applet

$$: \pi \left[\frac{1^2}{2} - \frac{1^2}{5} - 0 \right]$$

$$= \pi \left(\frac{1}{2} - \frac{1}{5}\right) = \pi \left(\frac{5}{2} - \frac{1}{5}\right) = \frac{3\pi}{10}$$

・ロト・西ト・ヨト・ヨー つくぐ

Suppose we wish to find the volume of the solid obtained by rotating the first quadrant region bounded by $y = x - x^3$ about the y-axis.

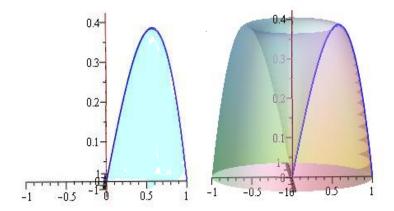

Figure: $y = x - x^3$, and the solid obtained from rotation about the *y*-axis.

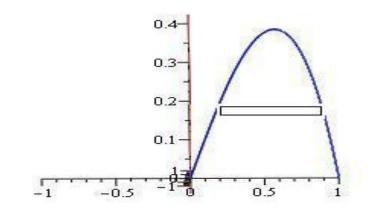

Figure: $y = x - x^3$. We can't find inner and outer radii (left and right functions) because we can't solve for *x*!!

()

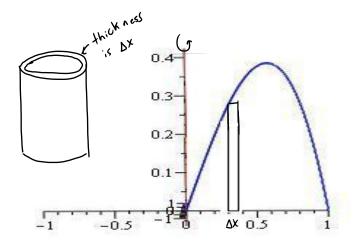

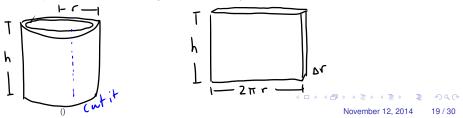

Figure: $y = x - x^3$, We can rotate vertical rectangles, but we won't get disks or washers!! Le get Cylindricel Shells,

Section 5.3: Method of Cylindrical Shells

Suppose we take a thin strip (with width Δr) that is parallel to the axis of rotation. When we revolve this, we obtain a very thin cylindrical shell with volume

$$V = 2\pi rh\Delta r$$

where r is the average radius (distance between strip and the axis of rotation), and h is the height of the strip.

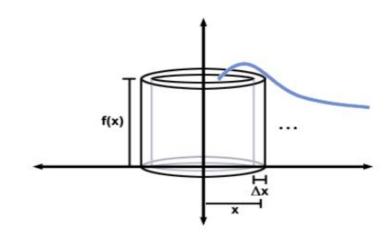

Figure: Revolving a vertical strip about a vertical axis creates a thin cylindrical shell.

Revolution about the x-axis: Method of Shells

If the region is between the *x*-axis and the positive function y = f(x), and the axis of revolution is the *y*-axis, then

$$\Delta r = \Delta x$$
, $r = x$, and $h = f(x)$.

One shell has volume $V = 2\pi x f(x) \Delta x$. The whole solid has volume

$$V = \int_a^b 2\pi x f(x) \, dx$$
