Section 1.1: Limits of Functions Using Numerical and Graphical **Techniques**

Recall: For a line y = mx + b, the slope tells us how a change in x (Δx) causes a change in y (Δy) . In fact, the slope $m = \frac{\Delta y}{\Delta x}$.

For a non-line curve, y = f(x) we wanted to define *slope*. We still want slope to say something about how y changes if x changes. But we don't expect slope to be the same number for every x.

1/70

We want to define the slope of a **tangent line**.

Slope of the Tangent Line

We consider a sequence of points $Q_1 = (x_1, f(x_1))$, $Q_2 = (x_2, f(x_2))$, and so forth in such a way that the *x*-values are getting closer to *c*. Note that the resulting secant lines tend to have slopes closer to that of the tangent line.

Slope of the Tangent Line $m_{sec} = \frac{f(x) - f(c)}{x - c}$

This is a limit process. We can write this as

$$m_{tan} = \lim_{x \to c} \frac{f(x) - f(c)}{x - c}$$

3/70

(read "the limit as *x* approaches *c* of ...").

This required us to define what a limit is.

A Working Definition of a Limit

Definition: Let *f* be defined on an open interval containing the number *c* except possibly at *c*. Then

$$\lim_{x\to c}f(x)=L$$

provided the value of f(x) can be made arbitrarily close to the number *L* by taking *x* sufficiently close to *c* but not equal to *c*.

January 18, 2017

4/70

We considered the example (using a calculator)

$\lim_{x\to 0}\frac{e^x-1}{x}$		
X	$f(x) = \frac{e^{x}-1}{x}$	to Opess theor
-0.1	0.9516	3 x close but
-0.01	0.9950	5
-0.001	0.9995	openter
0	undefined	, c but than c
0.001	1.0005	a close to
0.01	1.0050	
0.1	1.0517	۱ J

From the values, we conclude that $\lim_{x\to 0} \frac{e^x - 1}{x} = 1$.

э

Left and Right Hand Limits

In our examples, we considered x-values to the left (less than) and to the right (greater than) c. This illustrates the notion of **one sided limits**. We have a special notation for this.

Left Hand Limit: We write

$$\lim_{x\to c^-}f(x)=L_L$$

and say the limit as x approaches c from the left of f(x) equals L_L provided we can make f(x) arbitrarily close to the number L_L by taking x sufficiently close to, but less than c.

6/70

Left and Right Hand Limits

Right Hand Limit: We write

$$\lim_{x\to c^+} f(x) = L_R$$

and say the limit as x approaches c from the right of f(x) equals L_R provided we can make f(x) arbitrarily close to the number L_R by taking x sufficiently close to, but greater than c.

Some other common phrases:

"from the left" is the same as "from below" "from the right" is the same as "from above."

7/70

Example

Plot the function
$$f(x) = \begin{cases} x^2, & x < 1 \\ 2, & x = 1 \\ 1, & x > 1 \end{cases}$$
 Investigate $\lim_{x \to 1} f(x)$ using the graph.

Observations

Observation 1: The limit *L* of a function f(x) as *x* approaches *c* does not depend on whether f(c) exists or what it's value may be.

Observation 2: If $\lim_{x\to c} f(x) = L$, then the number *L* is unique. That is, a function can not have two different limits as *x* approaches a single number *c*.

Observation 3: A function need not have a limit as *x* approaches *c*. If f(x) can not be made arbitrarily close to any one number *L* as *x* approaches *c*, then we say that $\lim_{x\to c} f(x)$ **does not exist** (shorthand **DNE**).

Questions

(1) True or False It is possible that both $\lim_{x\to 3} f(x) = 5$ AND f(3) = 7. $f(c) \text{ doesn't matter$
