Section 4: Bernoulli Equations

Suppose P(x) and f(x) are continuous on some interval (a, b) and n is a real number different from 0 or 1 (not necessarily an integer). An equation of the form

$$\frac{dy}{dx} + P(x)y = f(x)y^n$$

is called a Bernoulli equation.

Observation: This equation has the flavor of a linear ODE, but since $n \neq 0, 1$ it is necessarily nonlinear. So our previous approach involving an integrating factor does not apply directly. Fortunately, we can use a change of variables to obtain a related linear equation.

Solving the Bernoulli Equation

$$\frac{dy}{dx} + P(x)y = f(x)y^n$$

Let the new dependendent variable is be defined by

$$u = y^{1-n}$$
. Then $\frac{du}{dx} = (i-n)y^{1-n-1}\frac{dy}{dx} = (i-n)\overline{y}^n \frac{dy}{dx}$

- M

Divide the ODE by
$$y^{n}$$

 $y^{n} \frac{dy}{dx} + P(x)y^{n}y = f(x)y^{n}y^{n}$
 $y^{n} \frac{dy}{dx} + P(x)y^{n} = f(x)$

The equation for u is * n + 1 $\frac{1}{1-n} \frac{du}{dx} + P(x)u = f(x)$ So 1-0 =0 It solves the 1st order linear equation $\frac{d\mu}{dx}$ + (1-n) P(x) μ = (1-n) f(x) The form here is $\frac{du}{dx}$ + P₁(x) u = f₁(x) where $P_i(x) = (i-n)P(x)$ and $f_i(x) = (i-n)f(x)$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Solve this using an integrating factor.
Since
$$u = y^{-n}$$
, $y = u^{-n}$.

Example

Solve the initial value problem $y' - y = -e^{2x}y^3$, subject to y(0) = 1.

The Bernoulli equation
$$\frac{dy}{dx} - y = -\frac{e^{x}y^{3}}{e^{y}}$$
 has $n=3$.
Let $u: y^{1-3} = y^{2}$. Then $\frac{du}{dx} = -2y^{3} \frac{dy}{dx}$.
Dividing by y^{3} $y^{3} \frac{dy}{dx} - y^{3}y = -\frac{e^{x}y^{3}y^{-3}}{1}$
 $-\frac{1}{2} \frac{du}{dx} - u = -\frac{e^{x}}{e^{x}}$

<□▶ <□▶ < □▶ < □▶ < □▶ < □ > ○ ○ ○

In studered form
$$\frac{du}{dx} + 2u = \partial e^{2x}$$
 $P_{i(k)} = 2$
The integrating factor $\mu = e^{\int P_{i(k)} dx} = e^{\int 2dx} = 2x$
Multiply by μ $\frac{d}{dx} \left(2x \\ e^{2x} \\ u \right) = \partial e^{2x} \frac{2x}{e^{2x}} = \partial e^{4x}$
 $\int \frac{d}{dx} \left(e^{2x} \\ u \right) dx = \int 2e^{4x} dx$
 $e^{2x} \\ u = \frac{1}{2} e^{4x} dx$
 $u = \frac{1}{2} e^{4x} + C$
 $u = \frac{1}{2} e^{4x} + C$
 $u = \frac{1}{2} e^{4x} + C$

Since
$$u = y^2$$
, $y = u^2 = \frac{1}{\sqrt{u}}$. Hence

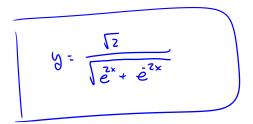

$$y = \frac{1}{\sqrt{\frac{1}{2}e^{2x} + Ce^{2x}}}$$
 Now apply $y(0) = 1$.

$$1 = \frac{1}{\sqrt{\frac{1}{2}e^{\circ} + (e^{\circ})}} = \frac{1}{\sqrt{\frac{1}{2} + C}}$$

$$\begin{bmatrix} \frac{1}{2} + C & = \\ \frac{1}{2} + C & = \\ \end{bmatrix}^{2} = \begin{bmatrix} 2 \\ \Rightarrow \end{bmatrix} \xrightarrow{2} C = \begin{bmatrix} -\frac{1}{2} \\ = \\ \frac{1}{2} \end{bmatrix} = \begin{bmatrix} 2 \\ 2 \end{bmatrix}$$

イロト イラト イヨト イヨト ヨー つへで January 24, 2019 8 / 29 The solution to the IVP is

$$\mathcal{Y} = \frac{1}{\sqrt{\frac{1}{2}e^{2x} + \frac{1}{2}e^{2x}}} = \sqrt{\frac{1}{2}\sqrt{\frac{2}{2}e^{2x} + e^{2x}}}$$

Exact Equations

We considered first order equations of the form

$$M(x, y) dx + N(x, y) dy = 0.$$
 (1)

January 24, 2019

10/29

The left side is called a *differential form*. We will assume here that M and N are continuous on some (shared) region in the plane.

Definition: The equation (1) is called an **exact equation** on some rectangle *R* if there exists a function F(x, y) such that

$$\frac{\partial F}{\partial x} = M(x, y) \text{ and } \frac{\partial F}{\partial y} = N(x, y) \text{ for every } (x, y) \text{ in } R. F with respect to x holding y constant holding x constant holding x$$

Exact Equation Solution

If M(x, y) dx + N(x, y) dy = 0 happens to be exact, then it is equivalent to

$$\frac{\partial F}{\partial x}\,dx + \frac{\partial F}{\partial y}\,dy = 0$$

January 24, 2019

11/29

This implies that the function F is constant on R and solutions to the

DE are given by the relation

$$F(x,y) = C$$

This equation defines solutions implicitly.

Recognizing Exactness

There is a theorem from calculus that ensures that if a function F has first partials on a domain, and if those partials are continuous, then the second mixed partials are equal. That is,

Exact Equations

Theorem: Let M and N be continuous on some rectangle R in the plane. Then the equation

$$M(x, y) \, dx + N(x, y) \, dy = 0$$

is exact if and only if

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}.$$

イロト イヨト イヨト イヨト

Example

Show that the equation is exact and obtain a family of solutions.

$$(2xy - \sec^2 x) \, dx + (x^2 + 2y) \, dy = 0$$

$$M(x,y) = 2xy - 5ec^{2}x \quad \text{and} \quad N(x,y) = x^{2} + 2y$$

$$\frac{\partial M}{\partial y} = 2x \cdot 1 - 0 = 2x$$
Treat x as constant
$$\frac{\partial N}{\partial x} = 2x + 0 = 2x$$
Treat y as constant

January 24, 2019 14 / 29

イロト イヨト イヨト イヨト

$$\frac{\partial M}{\partial y} = 2x = \frac{\partial N}{\partial x} + \text{the equation is exact.}$$

Solutions to the ODE will have the form
 $F(x,y) = C$ for some function F.
Use know that $\frac{\partial F}{\partial x} = n$ and $\frac{\partial F}{\partial y} = N$.
 $\frac{\partial F}{\partial x} = 2xy - Sec^2 x$
 $\frac{\partial F}{\partial y} = x^2 + 2y$
