# July 19 Math 1190 sec. 51 Summer 2017

A plane is flying at a fixed altitude and is tracked by a radar. When the horizontal distance between the plane and the radar station is 10 mi, the pilot notes a flying speed of 400 mi/hr. At this same instant, the radar attendant observes that the straight line distance between the plane and the radar is changing at a rate of 320 mi/hr. What is the altitude of the plane?

What type of problem is this?

(a) an applied optimization problem

(b) an area finding problem

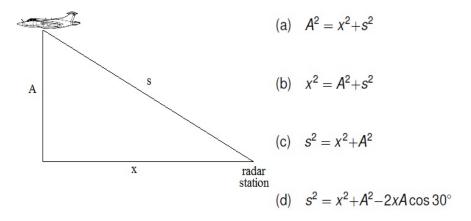

(c) a related rates problem

(d) a Newton's law of cooling problem

July 18, 2017

2/35

Letting *x* be the plane's distance from the station, *A* the altitude, and *s* the straight line distance, *x*, *A*, and *s* are related by

### Plane Example Continued

We're given that  $\frac{dx}{dt} = 400$  mi/hr and  $\frac{ds}{dt} = 320$  mi/hr when x = 10 mi. Determine the (constant) altitude of the plane.

# Example

Find the point (a, b) on the parabola  $y = \sqrt{x}$  that is closest to the point  $(\frac{9}{2}, 0)$ .

Then show that the line through the points (a, b) and  $(\frac{9}{2}, 0)$  is perpedicular to the line tangent to the graph of  $y = \sqrt{x}$  at the point (a, b).

# Example

Evaluate 
$$\frac{d}{dx} \left[ \int_{\sin x}^{x^3} t^2 e^t dt \right]$$

The Fundamental Theorem can be combined with the chain rule in the following general way due to Leibniz:

Suppose *f* is continuous on an interval *I* and that the functions a(x) and b(x) are differentiable functions with ranges contained in *I*. Then

$$\frac{d}{dx} \int_{a(x)}^{b(x)} f(t) \, dt = f(b(x)) \, b'(x) - f(a(x)) \, a'(x)$$

July 18, 2017

15/35

$$\frac{d}{dx}\left[\int_{3x}^{e^{x}}\sin\left(\frac{1}{t}\right) dt\right] =$$

(a) 
$$\sin\left(\frac{1}{e^x}\right) - \sin\left(\frac{1}{3x}\right)$$

(b) 
$$e^x \sin(\frac{1}{e^x}) - 3\sin(\frac{1}{3x})$$

(c) 
$$-e^x \cos\left(\frac{1}{e^x}\right) + 3\cos\left(\frac{1}{3x}\right)$$

(d) 
$$e^x \sin(\ln(e^x)) - 3\sin(\ln(3x))$$

# Example

Find the most general antiderivative of the function  $f(x) = \frac{x^3 - \sqrt{x} + 3}{x}$ .

The most general antiderivative of  $g(x) = \frac{4-5x+x^6}{x^2}$  is

(a) 
$$G(x) = -\frac{4}{x} - 5\ln|x| + \frac{x^5}{5} + C$$
  
(b)  $G(x) = 4\ln|x^2| - 5\ln|x| + \frac{3}{7}\frac{x^7}{x^3} + C$   
(c)  $G(x) = -\frac{4}{3x^3} - 5\ln|x| + \frac{x^5}{5} + C$   
(d)  $G(x) = \frac{4x - \frac{5}{2}x^2 + \frac{x^7}{7}}{\frac{x^3}{3}} + C$ 

True or False If a and b are any positive numbers, then

$$\int_a^b \frac{1}{x} \, dx = \ln(b) - \ln(a).$$

True or False If a and b are any positive numbers, then

$$\int_{a}^{b} \frac{1}{x^{2}} dx = \ln(b^{2}) - \ln(a^{2}).$$

Example:  
(a) Evaluate 
$$\frac{d}{dx} \ln(x^2 + 1)$$

(b) Evaluate 
$$\int_0^2 \frac{2x}{x^2+1} dx$$

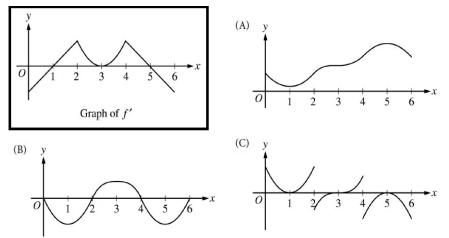

Figure: The graph of f'(x) is shown in the upper left. Which of the three graphs could be the graph of f(x)?

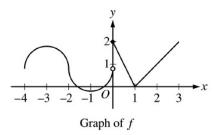

1. 
$$\lim_{x \to \pi} \frac{\cos x + \sin(2x) + 1}{x^2 - \pi^2}$$
 is  
(A) 
$$\frac{1}{2\pi}$$
(B) 
$$\frac{1}{\pi}$$
(C) 1  
(D) nonexistent

Figure: Evaluate the given limit.

23/35

The graph of the piecewise-defined function *f* is shown in the figure above. The graph has a vertical tangent line at x = -2 and horizontal tangent lines at x = -3 and x = -1. What are all values of *x*, -4 < x < 3, at which *f* is continuous but not differentiable?

(A) 
$$x = 1$$

- (B) x = -2 and x = 0
- (C) x = -2 and x = 1
- (D) x = 0 and x = 1

### **One Sided Limits**

Let f be the piecewise linear function

$$f(x) = \begin{cases} 2x - 2, & \text{for } x < 3\\ 2x - 4, & \text{for } x \ge 3 \end{cases}$$

#### Compute

(I) 
$$\lim_{h \to 0^-} \frac{f(3+h) - f(3)}{h}$$
 and

(II) 
$$\lim_{h \to 0^+} \frac{f(3+h) - f(3)}{h}$$

#### Question Let *f* be the piecewise linear function

$$f(x) = \begin{cases} 2x - 2, & \text{for } x < 3\\ 2x - 4, & \text{for } x \ge 3 \end{cases}$$

Which of the following statements is/are true

(I) 
$$\lim_{h \to 0^-} \frac{f(3+h) - f(3)}{h} = 2$$
, (II)  $\lim_{h \to 0^+} \frac{f(3+h) - f(3)}{h} = 2$ , (III)  $f'(3) = 2$ 

(a) none

(b) II only

(c) I and II only

(d) I and II and III

If 
$$f(x) = \int_{1}^{x^{3}} \frac{1}{1 + \ln t} dt$$
 for  $x \ge 1$ , then  $f'(2) =$   
(a)  $\frac{1}{1 + \ln 2}$   
(b)  $\frac{12}{1 + \ln 2}$   
(c)  $\frac{1}{1 + \ln 8}$   
(d)  $\frac{12}{1 + \ln 8}$

#### Question Find the derivative of the function

$$f(x) = \tan^2(\log_3 x).$$

э

28/35

July 18, 2017

(a) 
$$f'(x) = \sec^4(\log_3 x)$$

(b) 
$$f'(x) = \frac{2\tan(\log_3 x)\sec^2(\log_3 x)}{x\ln 3}$$

(c) 
$$f'(x) = \frac{2}{x} \tan(\log_3 x) \sec^2(\log_3 x)$$

(d) 
$$f'(x) = \frac{\tan^3(\log_3 x)}{3} \frac{1}{x \ln 3}$$

# Shipping Box

A shipping company limits the size of boxes that can be shipped without additional fees. The girth<sup>1</sup> plus length must not exceed 108 inches. Determine the dimensions of the largest rectangular box with a square base that can be shipped without incurring extra fees.
