#### June 20 Math 2306 sec 52 Summer 2016

#### Section 6: Linear Equations Theory and Terminology

We are considering an *n*<sup>th</sup> order, linear, homogeneous ODE

$$a_n(x)\frac{d^ny}{dx^n} + a_{n-1}(x)\frac{d^{n-1}y}{dx^{n-1}} + \dots + a_1(x)\frac{dy}{dx} + a_0(x)y = 0$$

and assuming that each  $a_i$  is continuous and  $a_n$  is never zero on the interval of interest.

< ロ > < 同 > < 回 > < 回 >

# Principle of Superposition: Linear, Homogeneous ODE

**Theorem:** If  $y_1, y_2, \ldots, y_k$  are all solutions of this homogeneous equation on an interval *I*, then the *linear combination* 

$$y(x) = c_1 y_1(x) + c_2 y_2(x) + \cdots + c_k y_k(x)$$

June 16, 2016

2/86

is also a solution on I for any choice of constants  $c_1, \ldots, c_k$ .

This is called the **principle of superposition**.

#### Linear Dependence

**Definition:** A set of functions  $f_1(x)$ ,  $f_2(x)$ , ...,  $f_n(x)$  are said to be **linearly dependent** on an interval *I* if there exists a set of constants  $c_1, c_2, ..., c_n$  with at least one of them being nonzero such that

 $c_1 f_1(x) + c_2 f_2(x) + \dots + c_n f_n(x) = 0$  for all x in I.

A set of functions that is not linearly dependent on *I* is said to be **linearly independent** on *I*.

We note that if the only way to satisfy the above equation is to set each  $c_i$  to zero, then the functions are **linearly independent**. If at least one of the  $c_i$  can be nonzero, they are **linearly dependent**.

#### Definition of Wronskian

Let  $f_1, f_2, ..., f_n$  posses at least n - 1 continuous derivatives on an interval *I*. The **Wronskian** of this set of functions is the determinant

$$W(f_1, f_2, \dots, f_n)(x) = \begin{vmatrix} f_1 & f_2 & \cdots & f_n \\ f'_1 & f'_2 & \cdots & f'_n \\ \vdots & \vdots & \vdots & \vdots \\ f_1^{(n-1)} & f_2^{(n-1)} & \cdots & f_n^{(n-1)} \end{vmatrix}$$

.

June 16, 2016

4/86

(Note that, in general, this Wronskian is a function of the independent variable x.)

## Theorem (a test for linear independence)

Let  $f_1, f_2, \ldots, f_n$  be n-1 times continuously differentiable on an interval *I*. If there exists  $x_0$  in *I* such that  $W(f_1, f_2, \ldots, f_n)(x_0) \neq 0$ , then the functions are **linearly independent** on *I*.

If  $y_1, y_2, ..., y_n$  are *n* solutions of the linear homogeneous  $n^{th}$  order equation on an interval *I*, then the solutions are **linearly independent** on *I* if and only if  $W(y_1, y_2, ..., y_n)(x) \neq 0$  for\* each *x* in *I*.

<sup>\*</sup>For solutions of one linear homogeneous ODE, the Wronskian is either always zero or is never zero.

Determine if the functions are linearly dependent or independent:

$$y_{1} = e^{x}, \quad y_{2} = e^{-2x} \quad I = (-\infty, \infty)$$
  
We'll use the Wronskian.  

$$W(y_{1,y}y_{2})(x) = \begin{vmatrix} y_{1} & y_{2} \\ y_{1}^{1} & y_{2}^{\prime} \end{vmatrix} = \begin{vmatrix} e^{x} & e^{2x} \\ e^{x} & -2e^{2x} \\ e^{x} & -2e^{2x} \end{vmatrix}$$

$$= e^{x}(-2e^{2x}) - e^{x}(e^{2x}) = -2e^{x} - e^{x} = -3e^{x}$$

# Fundamental Solution Set

We're still considering this equation

$$a_n(x)rac{d^n y}{dx^n} + a_{n-1}(x)rac{d^{n-1} y}{dx^{n-1}} + \dots + a_1(x)rac{dy}{dx} + a_0(x)y = 0$$

with the assumptions  $a_n(x) \neq 0$  and  $a_i(x)$  are continuous on *I*.

**Definition:** A set of functions  $y_1, y_2, ..., y_n$  is a **fundamental solution set** of the  $n^{th}$  order homogeneous equation provided they

June 16, 2016

8/86

- (i) are solutions of the equation,
- (ii) there are *n* of them, and
- (iii) they are linearly independent.

**Theorem:** Under the assumed conditions, the equation has a fundamental solution set.

# General Solution of *n*<sup>th</sup> order Linear Homogeneous Equation

Let  $y_1, y_2, ..., y_n$  be a fundamental solution set of the  $n^{th}$  order linear homogeneous equation. Then the **general solution** of the equation is

$$y(x) = c_1 y_1(x) + c_2 y_2(x) + \cdots + c_n y_n(x),$$

where  $c_1, c_2, \ldots, c_n$  are arbitrary constants.

## Example

Verify that  $y_1 = e^x$  and  $y_2 = e^{-x}$  form a fundamental solution set of the ODE

$$y'' - y = 0$$
 on  $(-\infty, \infty)$ ,

and determine the general solution.

To verify 
$$y_{1}, y_{2}$$
 form a find. Solution set check  
(i) they're solutions  
(ii) there are "n" of them  $\leftarrow 2^{nd}$  order, 2 solns.  
(iii) they're lin. independent,  
(i)  $y_{1}=e^{x}, y_{1}'=e^{x}, y_{1}''=e^{x}, y_{1}''-y_{1}=0$   
 $e^{x}-e^{x}=0$  yeo solves  
 $0=0$  V y' it,  
June 16, 2016 10/86

$$y_2 = e^{-x}, y_2 = e^{-x}, y_3 = e^{-x}$$
  
 $e^{-x} = y_2 = e^{-x}, y_3 = e^{-x}$   
 $e^{-x} = e^{-x} = 0$   
 $e^{-x} = e^{-x} = 0$   
 $0 = 0^{-x}, t = t_{00}$ 

(iii) Let's use the Wronskien  

$$W(y_1, y_2)(x) = \begin{vmatrix} y_1 & y_2 \\ y_1' & y_2' \end{vmatrix} = \begin{vmatrix} e^x & \bar{e}^x \\ e^x & -\bar{e}^x \end{vmatrix}$$

$$= \overset{\times}{e} \left(-\frac{\bar{e}^x}{e^x}\right) - \overset{\times}{e} \left(\frac{\bar{e}^x}{e^x}\right) = -1 = -2.$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Since 
$$W(y_{1}, y_{2})(x) \neq 0$$
 they are linearly  
independent.  
We conclude that  $y_{1} = e^{x}$ ,  $y_{2} = e^{x}$  forms a  
fundamental solution set.

The general solution to the ODE is

$$y = C_1 y_1 + C_2 y_2$$

$$y = C_1 e + C_2 e$$

$$y_{\rho_{2}} = -7x \text{ solves } x^{2}y'' - 4xy' + 6y = -14x.$$

$$y_{\rho_{z}}^{*} -7x, y_{\rho_{z}}^{'} = -7, y_{\rho_{z}}^{''} = 0$$

$$x^{2}y_{\rho_{z}}^{''} -9x y_{\rho_{z}}^{'} + 6y_{\rho_{z}} \stackrel{?}{=} -19x$$

$$x^{2}(o) -9x (-7) + 6(-7x) \stackrel{?}{=} -19x$$

$$y_{\rho_{z}}^{*} -9x y_{\rho_{z}}^{*} + 6(-7x) \stackrel{?}{=} -19x$$

$$y_{\rho_{z}}^{*} -9x y_{\rho_{z}}^{*} + 6(-7x) \stackrel{?}{=} -19x$$

yes yp2=-7x solves x2y"-4xy'+6y = -14x June 16,2016 23/86 Example  $x^2y'' - 4xy' + 6y = 36 - 14x$ 

(c) Recall that  $y_1 = x^3$  and  $y_2 = x^2$  is a fundamental solution set of

$$x^2y'' - 4xy' + 6y = 0$$

Use this along with results (a) and (b) to write the general solution of  $x^2y'' - 4xy' + 6y = 36 - 14x$ . (Verify that your result is correct.)

By the principle of superposition for nonhomogeneous  
equations  
$$y_p = y_{p_1} + y_{p_2}$$
  
 $y_p = 6 - 7x$   
Also,  $y_c = c_1 y_1 + c_2 y_2 = c_1 x^3 + c_2 x^2$ 

June 16, 2016 24 / 86

The general solution to 
$$x^{2}y'' - 4xy' + 6y = 36 - 14x$$
 is  
 $y = C_{1}x^{2} + C_{2}x^{2} + 6 - 7x$   
\*  $y = y_{2} + 4y_{2}$   
Let's verify this is correct.  
 $y' = 3C_{1}x^{2} + 2C_{2}x + 0 - 7 = 3C_{1}x^{2} + 2C_{2}x - 7$   
 $y'' = 6C_{1}x + 2C_{2} - 0 = 6C_{1}x + 2C_{2}$   
 $x^{2}y'' - 4xy' + 6y \stackrel{?}{=} 3b - 14x$ 

June 16, 2016 25 / 86

996

$$x^{2} (6c_{1} x + 2c_{2}) - 4x (3c_{1} x^{2} + 2c_{2} x - 7) + 6 (c_{1} x^{3} + (c_{2} x^{2} + 6 - 7x)^{2} = 36 - 14x$$

$$6c_{1} x^{3} + 2c_{2} x^{2} - 12c_{1} x^{3} - 8c_{2} x^{2} + 28x + 6c_{1} x^{3} + 6c_{2} x^{2} + 36 - 42x \stackrel{?}{=} 36 - 14x$$

$$c_{1} x^{3} (6 - 12 + 6) + c_{2} x^{2} (2 - 8 + 6) + 28x - 42x + 36 \stackrel{?}{=} 36 - 14x$$

$$0 + 0 - 14x + 36 \stackrel{?}{=} 36 - 14x$$

$$-14x + 36 = 36 - 14x$$

$$4c_{5}, ow solution is correct!$$

Solve the IVP

$$x^{2}y'' - 4xy' + 6y = 36 - 14x, \quad y(1) = 0, \quad y'(1) = -5$$
  
From before  $y = C_{1}x^{2} + C_{2}x^{2} + 6 - 7x$   
 $y' = 3C_{1}x^{2} + 2C_{2}x - 7$   
 $y(1) = C_{1}(1)^{2} + C_{2}(1)^{2} + 6 - 7(1) = 0 \implies C_{1} + C_{2} = 1$   
 $y'(1) = 3C_{1}(1)^{2} + 2C_{2}(1) - 7 \implies C_{1} + 2C_{2} = 2$

#### Section 7: Reduction of Order

We'll focus on second order, linear, homogeneous equations. Recall that such an equation has the form

$$a_2(x)\frac{d^2y}{dx^2} + a_1(x)\frac{dy}{dx} + a_0(x)y = 0.$$

Let us assume that  $a_2(x) \neq 0$  on the interval of interest. We will write our equation in **standard form** 

$$\frac{d^2y}{dx^2} + P(x)\frac{dy}{dx} + Q(x)y = 0$$

June 16, 2016

30 / 86

where  $P = a_1/a_2$  and  $Q = a_0/a_2$ .

$$\frac{d^2y}{dx^2} + P(x)\frac{dy}{dx} + Q(x)y = 0$$

Recall that every fundmantal solution set will consist of two linearly independent solutions  $y_1$  and  $y_2$ , and the general solution will have the form

$$y = c_1 y_1(x) + c_2 y_2(x).$$

Suppose we happen to know one solution  $y_1(x)$ . Reduction of order is a method for finding a second linearly independent solution  $y_2(x)$ that starts with the assumption that

$$y_2(x) = u(x)y_1(x)$$

June 16, 2016

31/86

for some function u(x). The method involves finding the function u.

#### Example

Verify that  $y_1 = e^{-x}$  is a solution of y'' - y = 0. Then find a second solution  $y_2$  of the form

$$y_2(x) = u(x)y_1(x) = e^{-x}u(x).$$

Confirm that the pair  $y_1, y_2$  is linearly independent.

See Slides 10, 11 for the Verification part. Set  $y_{1} = \overline{e^{x}}u(x)$ . Then  $y' = -e^{x}u(x) + e^{x}u'(x)$  $y_{2}^{"} = e^{x} u(x) - e^{x} u'(x) - e^{x} u'(x) + e^{x} u''(x)$  $= e^{-x} u(x) - 2e^{-x} u'(x) + e^{-x} u''(x)$ 

June 16, 2016 32 / 86

We require 
$$y_{z}'' - y_{z} = 0$$
  
 $y_{z}'' - y_{z} = e^{-x} u(x) - 2e^{-x} u'(x) + e^{-x} u''(x) - e^{-x} u(x) = 0$   
 $e^{-x} (-2u'(x) + u''(x)) = 0$   
 $\Rightarrow u''(x) - 2u'(x) = 0$   
If we set  $w = u'(x)$ , then we set a 1st order  
sepandale eqn.  
 $w' - 2w = 0$ 

June 16, 2016 33 / 86

◆□ ▶ ◆□ ▶ ◆ 臣 ▶ ◆ 臣 ▶ ● 臣 ● のへで

Solve this 
$$\frac{dw}{dx} = 2w \Rightarrow \frac{dw}{dx} = 2$$
  
 $\int \frac{dw}{dx} = \sqrt{2} dx$  assuming  $W > 0$   
 $\int w dw = \sqrt{2} dx = 4e^{2x}$  where  $A = e^{Cx}$   
Let's Let  $A = 2$  so  $w = 2e^{2x}$ . As  $w = h'$   
 $u = \int w dx = \int 2e^{2x} dx = e^{2x}$ 

\* Ais any nonzero constant.

June 16, 2016 34 / 86

◆□> ◆◎> ◆注> ◆注> 二注:

Recall that by= uy, = & u(x), So

$$y_2 = e^{-x} \begin{pmatrix} 2x \\ e \end{pmatrix} = e^{x}$$

The general solution to 
$$y'' - y = 0$$
 is  
 $y = C_1 e^{-x} + C_2 e^{-x}$

## Generalization

Consider the equation **in standard form** with one known solution. Determine a second linearly independent solution.

$$\frac{d^2y}{dx^2} + P(x)\frac{dy}{dx} + Q(x)y = 0, \quad y_1(x) - -is \text{ known.}$$
Suppose  $y_2 = y_1 u = y_1(x)u(x)$   
then  $y_2' = y_1' u + y_1 u'$   
 $y_2'' = y_1'' u + y_1' u' + y_1' u' + y_1 u''$   
 $= y_1'' u + 2y_1' u' + y_1 u''$   
Plug into the ODE

June 16, 2016 38 / 86

$$\begin{aligned} y_{2}'' + P(\omega)y_{2}' + Q(\omega)y_{2} &= 0 \\ y_{1}''u + 2y_{1}'u' + y_{1}u'' + P(\omega)(y_{1}'u + y_{1}u') + Q(\omega)y_{1}u &= 0 \\ y_{1}u'' + (2y_{1}' + P(\omega)y_{1})u' + (y_{1}'' + P(\omega)y_{1}' + Q(\omega)y_{1})u &= 0 \\ * y_{1} \text{ solves } y_{1}'' + P(\omega)y_{1}' + Q(\omega)y_{1} &= 0 \\ * y_{1} \text{ solves } y_{1}'' + P(\omega)y_{1}' + Q(\omega)y_{1} &= 0 \\ * u'' + (2y_{1}' + P(\omega)y_{1})u' &= 0 \\ Lt \quad w^{2}u' . \text{ Divide by } y_{1} (assume its obe) \end{aligned}$$

w solves the 1st order eqn (and separable) Then  $W' + \left(2 \frac{\varphi'_1}{\varphi_1} + P(x)\right)W = 0$ Sepanate and Solve  $\frac{dw}{dx} = -\left(2 \frac{b_1}{b_1} + P(x)\right) W$  $\frac{1}{w} dw = -\left(z \frac{b_1}{b_1} + P(x)\right) dx$  $\frac{1}{1}$   $\frac{dy_1}{dx} = dy_1$ 

$$= -2 \frac{dy_1}{51} - P(x) dx$$

$$\int \frac{1}{w} dw = -2 \int \frac{dy_1}{y_1} - \int f(x) dx$$

$$\ln w = -2 \ln |y_1| - \int f(x) dx$$

$$\ln v = \ln y_1^2 - \int f(x) dx$$

$$e^{\ln w} = e^{(\ln y_1^2 - \int f(x) dx)}$$

$$w = y_1^2 e^{-\int f(x) dx} = \frac{-\int f(x) dx}{y_1^2}$$

June 16, 2016 41 / 86

・ロト・西ト・ヨト・ヨー うへの

Since 
$$w = u'$$
,  
 $u = \int w \, dx = \int \frac{-\int f(w) \, dx}{(y_1(w))^2} \, dx$ 

Finally,  

$$y_z = y_1 u = y_1 \int \frac{-\int f(w) dx}{(y_1(x))^2} dx$$

### Reduction of Order Formula

For the second order, homogeneous equation in standard form with one known solution  $y_1$ , a second linearly independent solution  $y_2$  is given by

$$y_2 = y_1(x) \int \frac{e^{-\int P(x) \, dx}}{(y_1(x))^2} \, dx$$

June 16, 2016 45 / 86

### Example

Find the general solution of the ODE given one known solution

$$x^{2}y'' - 3xy' + 4y = 0, \quad y_{1} = x^{2} \quad x \ge 0$$

$$y_{2} = y_{1} u \quad \text{where} \quad u = \int \frac{-\int P(x) dx}{(b_{1})^{2}} dx$$

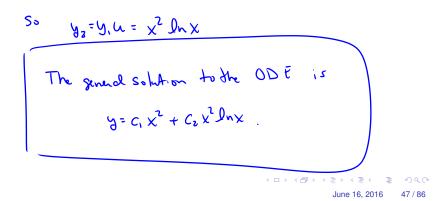

$$\text{Standard for } \qquad y'' - \frac{3}{x} y_{1}^{1} + \frac{y_{1}}{x^{2}} y = 0$$

$$P(x) = \frac{-3}{x}, \quad -\int P(x) dx = -\int \frac{-3}{x} dx = 3hx \quad = \ln x^{3}$$

$$\text{So} \quad e^{\int P(x) dx} = e^{\ln x^{3}} = x^{3}$$

June 16, 2016 46 / 86

$$u = \int \frac{e^{-\int \rho_{w} dx}}{(y_{1})^{2}} dx = \int \frac{x^{3}}{(x^{2})^{2}} dx = \int \frac{x^{3}}{x^{4}} dx$$
$$= \int \frac{1}{x} dx = \int hx$$

Let's verify that O yz solver the ODE and @ that yi, yz are lin. independent,

$$\begin{aligned} y_{2} &= \chi^{2} \ln x \\ y_{2}' &= 2 \chi \ln x + x^{2} \left(\frac{1}{x}\right) = 2 \chi \ln x + x \\ y_{2}'' &= 2 \ln x + 2 \chi \cdot \frac{1}{x} + 1 = 2 \ln x + 3 \\ \chi^{2} y_{2}'' - 3 \chi y_{2}'' + 4 y_{2} &\stackrel{?}{=} 0 \\ \chi^{2} (2 \ln x + 3) - 3 \chi (2 \chi \ln x + \chi) + 4 \chi^{2} \ln \chi \stackrel{?}{=} 0 \\ 2 \chi^{2} \ln x + 3 \chi^{2} - 6 \chi^{2} \ln x - 3 \chi^{2} + 4 \chi^{2} \ln \chi \stackrel{?}{=} 0 \end{aligned}$$

$$\chi^{2} \ln \chi \left( 2 - 6 + 4 \right) + \chi^{2} \left( 3 - 3 \right) \stackrel{?}{=} 0$$
  
 $0 = 0 \quad \forall z \text{ does solve the}$   
 $O = 0 \quad \forall z \text{ does solve the}$ 

Using the Wronskien

$$= 2x^{3} \ln x + x^{3} - 2x^{3} \ln x = x^{3}$$

<ロト < 団ト < 巨ト < 巨ト < 巨ト 三 の Q () June 16, 2016 49 / 86

 $W(y_{1}, y_{2})(x) = x^{3} \neq 0$ So Si, 52 are linealy independent.

### Example

Find the solution of the IVP where one solution of the ODE is given.

$$y'' + 4y' + 4y = 0 \quad y_1 = e^{-2x}, \quad y(0) = 3, \quad y'(0) = -2$$
  

$$y_2 = y_1 u \quad \text{when} \quad u^{\pm} \int \frac{e}{(y_1)^2} dx \quad y_1 = y$$
  

$$e^{\int P(x) dx} = e^{\int y_1 dx} = -4x$$
  

$$u^{\pm} \int \frac{e^{-4x}}{(e^{-2x})^2} dx = \int \frac{e^{-4x}}{e^{-4x}} dx = \int dx = x$$

э

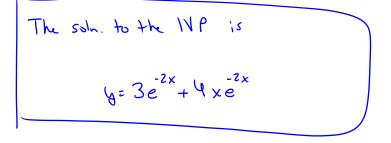

イロト イヨト イヨト イヨト

So  $y_2 = \chi e^{-2\chi}$  and the general solution is  $y_2 = C_1 e^{-2\chi} + C_2 \chi e^{-2\chi}$ .

$$\varphi(\sigma = C_1 e^2 + C_2 \circ \cdot e^2 = 3$$
$$C_1 = 3$$

 $-2.3 + C_2 = -2 \implies C_2 = -2+6 = 4$
