Section 6.5: Trigonometric Functions of a Real Variable and Their Graphs

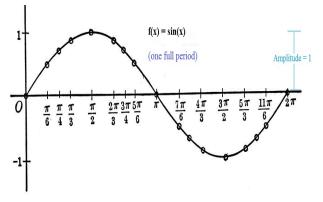

Figure: It's worth noting that major features (maximum, minimum, *x*-intercepts) divide the period into four equal parts.

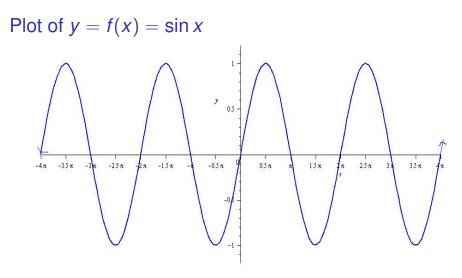

Figure: $y = \sin x$ over four full periods. Note the periodicity and the odd symmetry.

• • • • • • • • • • • • •

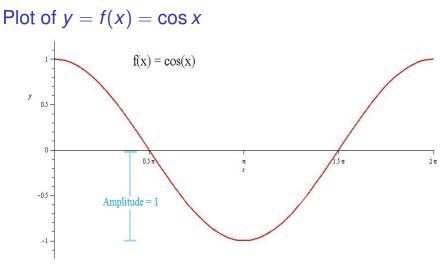

Figure: $y = \cos x$ over one full period.

November 8, 2018 3 / 39

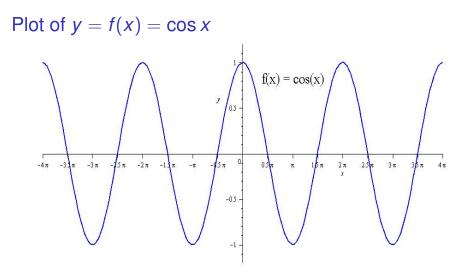

Figure: $y = \cos x$ over four full periods. Note the periodicity and the even symmetry

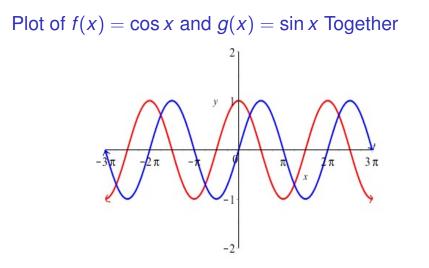

Figure: Note that the cofunction property $cos(x) = sin(\pi/2 - x)$ can be seen in the graphs.

A word of caution on using the unit circle

Our goal is to know and understand the properties of the trigonometric functions as **real valued functions of real variables**.

- They appear in many models of periodic processes (sound/water waves, seasonal processes, predator-prey interactions) that have no connection to triangles or circles.
- Right triangles and the unit circle provide powerful mnemonic devices.
- You'll often see x used as the independent variable—in this class and in Calculus to be sure! The point (x, y) = (cos s, sin s) on the unit circle are not the same (x, y) as in y = cos x. Get used to it!

Summary of Sine and Cosine Properties

Let $f(x) = \sin x$ and $g(x) = \cos x$. Then

- Both f and g are periodic with fundamental period 2π .
- The domain of both *f* and *g* is $(-\infty, \infty)$.
- The range of both f and g is [-1, 1]; they have amplitude 1.
- ► *f* is an odd function, i.e. $f(-x) = \sin(-x) = -\sin x = -f(x)$.
- ► *g* is an even function, i.e. $g(-x) = \cos(-x) = \cos x = g(x)$.
- ▶ Both *f* and *g* are continuous on their entire domain $(-\infty, \infty)$.
- The zeros of f are integer multiples of π, i.e. f(nπ) = 0 for n = 0,±1,±2,...
- The zeros of g are odd integer multiples of π/2, g (mπ/2) = 0 for m = ±1, ±3,...

Question

Let $f(x) = \sin x$, and suppose that f(a) = -0.62 for some real number *a*. Which of the following is true?

(a)
$$f(a+2\pi) = -0.62$$

(b) $f(2a) = -1.24$ \leftarrow outside of the range
(c) $f(-a) = 0.62$
 $\int \sin(-x) = -\sin(x)$ for all real x

(d) Only (a) and (b) are true.

(e) Only (a) and (c) are true.

True or False: The equation $\cos x = 2$ has no real solutions.

(a) True, and I'm confident.

(b) True, but I'm not confident.

(c) False, and I'm confident.

(d) False, but I'm not confident.

The Tangent

The function $\tan s = \frac{\sin s}{\cos s}$. Recall that $\cos s = 0$ whenever $s = \frac{m\pi}{2}$ for $m = \pm 1, \pm 3, \pm 5, \dots$

When $\cos s = 0$, $\sin s$ is either 1 or -1. Hence

Domain: The domain of the tangent function is all real number **except** odd multiples of $\pi/2$. We can write this as

$$\left\{ s \mid s \neq \frac{\pi}{2} + k\pi, \ k = 0, \pm 1, \pm 2, \dots \right\}$$

Moreover, the graph of the tangent function has vertical asymptotes at each odd multiple of $\pi/2$.

> November 8, 2018

The Tangent

Range: The range of the tangent function is **all real numbers.**

Symmetry: The function $f(s) = \tan s$ is odd. That is

$$f(-s) = \tan(-s) = -\tan s = -f(s).$$

Perodicity: The tangent function is periodic with fundamental period π . That is

 $tan(s + \pi) = tan s$ for all s in the domain.

Note: The period of the tangent function is π . This is different from the period of the sine and cosine.

> November 8, 2018

The Tangent

A few key tangent values:

And due to symmetry

S	$-\frac{\pi}{2}$	$-\frac{\pi}{3}$	$-\frac{\pi}{4}$	$-\frac{\pi}{6}$	0
tan s	undef.	-√3	-1	$-\frac{1}{\sqrt{3}}$	0

Here is an applet to plot two periods of the function $f(s) = \tan s$. GeoGebra Graph Applet: Sine, Cosine, and Tangent

November 8, 2018

Basic Plot $f(x) = \tan x$

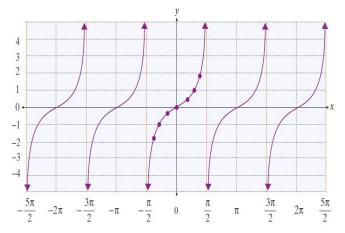

Figure: Plot of several periods of $f(x) = \tan x$. Note that the interval between adjacent asymptotes is the period π .

Cotangent: Using the Cofunction ID and Symmetry

$$\cot s = \tan\left(\frac{\pi}{2} - s\right) = \tan\left(-\left(s - \frac{\pi}{2}\right)\right) = -\tan\left(s - \frac{\pi}{2}\right)$$

So the graph of $f(s) = \cot s$ is the graph of $g(s) = \tan s$ under a horizontal shift $\pi/2$ units to the right followed by a reflection in the *s*-axis.

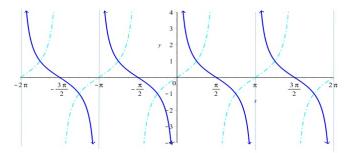

Figure: Plot of $f(x) = \cot x$. Note that the lines $x = n\pi$ for $n = 0, \pm 1, \pm 2, ...$ are vertical asymptotes to the graph. The dashed curve is $y = \tan x$.

Cosecant and Secant

Domains: Since $sin(n\pi) = 0$ for integers *n*,

Domain($\csc s$) = { $s \mid s \neq n\pi$, for integers n}.

Since $\cos\left(\frac{\pi}{2} + n\pi\right) = 0$ for integers *n*, the domain of sec *s* is

Domain(sec *s*) =
$$\left\{ s \mid s \neq \frac{\pi}{2} + n\pi, \text{ for integers } n \right\}$$
.

Ranges: Note that

$$|\csc s| = \frac{1}{|\sin s|} \ge 1$$
 and $|\sec s| = \frac{1}{|\cos s|} \ge 1$

so the range of both csc s and sec s is

$$(-\infty,-1]\cup [1,\infty).$$

November 8, 2018

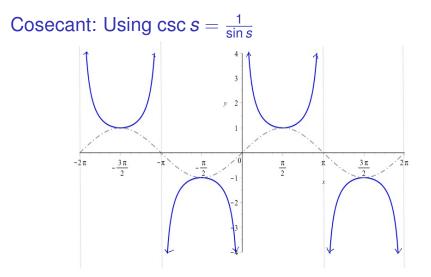

Figure: Two periods of $f(s) = \csc s$. The dashed curve is $y = \sin s$. Note the asymptotes $s = n\pi$ for integers *n* where sin *s* takes its zeros. The curves meet at the relative extrema and have the same period 2π .

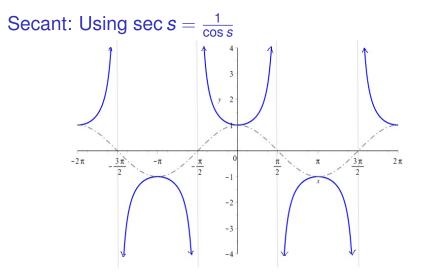

Figure: Two periods of $f(s) = \sec s$. The dashed curve is $y = \cos s$. Note the asymptotes $s = \pi/2 + n\pi$ for integers *n* where $\cos s$ takes its zeros. The curves meet at the relative extrema and have the same period 2π .

Question

Recall that the cosine is an even function and the sine is an odd function. Moreover,

$$\sec x = \frac{1}{\cos x}$$
 and $\csc x = \frac{1}{\sin x}$

Which of the following statements is true about the symmetry of the secant and cosecant.

- (a) Both of the secant and cosecant are even functions.
- (b) Both the secant and cosecant are odd functions.

(c)) Secant is even, and cosecant is odd.

- (d) Secant is odd, and cosecant is even.
- (e) Symmetry for secant and cosecant can't be deduced from symmetry of cosine and sine.

Section 6.6: Graphing Trigonometric Functions with Transformations

Our goal is to graph functions of the form

$$f(x) = a\sin(bx - c) + d$$
 or $f(x) = a\cos(bx - c) + d$

November 8, 2018

19/39

Note: here we will be graphing points (x, y) on a curve y = f(x).

Amplitude

Consider: $f(x) = a \sin(bx - c) + d$ or $f(x) = a \cos(bx - c) + d$

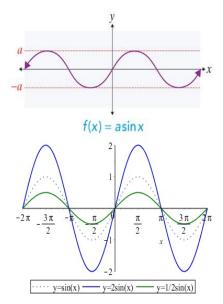

Definition: Let a be any nonzero real number. The amplitude of the function f defined above is the value |a|.

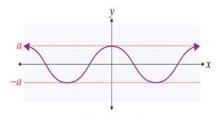

Recall that this is half the distance between the maximum and minimum values.

If a < 0 the graph is reflected in the x-axis. But the amplitude is still |a|.

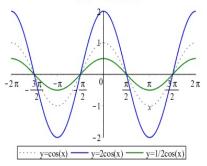

November 8, 2018

Amplitude

 $f(x) = a\cos x$

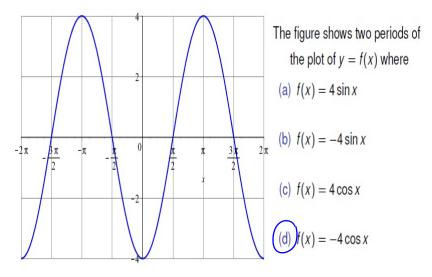

November 8, 2018 21 / 39

Example

Identify the amplitude A of each function. Determine if the graph is reflected in the x-axis.

(a)
$$f(x) = 3\sin(4x-2)+1$$
 A = 3 not reflected
(b) $f(x) = -5\sin(\frac{\pi x}{2})+7$ A = 5 yes reflected as
(c) $f(x) = 2-6\cos(2x+3)$ A = 6 yes reflected as
 $= -6\cos(2x+3) + 2$ A = 6 yes reflected as
