## October 10 MATH 1113 sec. 52 Fall 2018

#### Section 5.3: Inverse of an Exponential Function

**Definition:** Let a > 0 and  $a \neq 1$ . For x > 0 define  $\log_a(x)$  as a number such that

if 
$$y = \log_a(x)$$
 then  $x = a^y$ .

The function

$$F(x) = \log_a(x)$$

is called the **logarithm function of base** *a*. It has domain  $(0, \infty)$ , range  $(-\infty, \infty)$ , and if  $f(x) = a^x$  then

$$F(x)=f^{-1}(x).$$

1/17

In particular

- ►  $\log_a(a^x) = x$  for every real x, and
- $a^{\log_a(x)} = x$  for every x > 0.

# Evaluating Logs with a Calculator

Most logarithms can't be evaluated by hand. For example,  $\log_e(70) \approx 4.2485$ . No one memorizes that! Calculators tend to have two built in logarithm functions.

- Common Log base 10 denoted as log (note there is no subscript), and log(x) = log(x)
- ► Natural Log base *e* denoted<sup>1</sup> In  $\int_{M} (x) = \int_{M} (x) dx$

In Calculus, you'll find that the prefered base is e—the natural log. Base 10 logs still have some use such as in the Richter scale used to measure earthquakes.

<sup>&</sup>lt;sup>1</sup>The order LN instead of NL is probably due to the French name *le Logarithme Naturel* for this log.

## Evaluating Logs with a Calculator

Suppose we wish to evaluate  $\log_2(15)$ . You turn to a calculator, but there is no  $\log_2$  key! Fortunately, you're not out of luck. Every log can be stated in term of any other log by the following theorem:

**Theorem: (Change of Base)** Let *a*, *b*, and *M* be any positive numbers, then

$$\log_b(M) = rac{\log_a(M)}{\log_a(b)}.$$

What this says is that you can turn your log<sub>2</sub> problem into a log or In problem, and use your machine!

3/17

### Change of Base

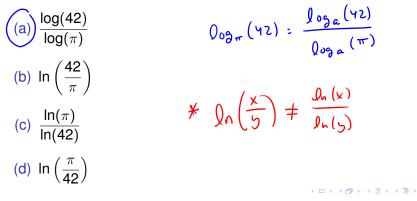

Here's the meat of our theorem again:  $\log_b(M) = \frac{\log_a(M)}{\log_a(b)}$ .

Express  $\log_2(15)$  in terms of the natural log. Use a calculator to approximate its value.

$$log_{2}(15) = \frac{ln(15)}{ln(2)}$$
  
 $\approx 3.9069$ 
 $log_{e}(4x) = ln(4x)$ 

Here's the meat of our theorem again: 
$$\log_b(M) = \frac{\log_a(M)}{\log_a(b)}$$
.

Suppose you wish to evaluate  $\log_{\pi}(42)$  using a calculator. Which of the following expressions could be used to find the desired value?

October 9, 2018 5 / 17

### Section 5.4: Properties of Logarithms

Let's recall the basic properties of exponentials. The logarithms have analog properties.

October 9, 2018

6/17

Let a > 0, with  $a \neq 1$ . Then for any real x and y

• 
$$a^{x+y} = a^x \cdot a^y$$
  
•  $a^{x-y} = \frac{a^x}{a^y}$   
•  $(a^x)^y = a^{xy}$ 

## Log of a Product

**Theorem:** Let *M* and *N* be any positive numbers and a > 0 with  $a \neq 1$ . Then

$$\log_a(MN) = \log_a(M) + \log_a(N).$$

#### **Illustrative Example:**

 $\log_2(16) = \log_2(2 \cdot 8) = \log_2(2) + \log_2(8).$ 

Note that this equation is the true statement

4 = 1 + 3.

October 9, 2018 7 / 17

イロト 不得 トイヨト イヨト 二日

Here's the meat of our theorem:  $\log_a(MN) = \log_a(M) + \log_a(N)$ .

Which of the following is equivalent to  $log_3(15)$ ?

(a) 
$$\log_3(5) + \log_3(3)$$

(b) 
$$\log_3(10) + \log_3(5)$$

(c)  $\log_3(3) \cdot \log_3(5)$ 

(d) all of the above are equivalent

(e) none of the above is equivalent

$$= l_{033}(5.3)$$
  
=  $l_{033}(5) + l_{033}(3)$ 

## Log of a Power

**Theorem:** Let M be any positive number, a be any positive number different from 1, and p be any real number. Then

 $\log_a(M^p) = p \log_a(M).$ 

**Illustrative Example:** 

$$\log_2(64) = \log_2(4^3) = 3\log_2(4).$$

Note that this equation is the true statement

 $\mathbf{6}=\mathbf{3}\cdot\mathbf{2}.$ 

Here's the meat of our theorem:  $\log_a(M^p) = p \log_a(M)$ . Which of the following is equivalent to  $\log_7(125)$ ?

(a)  $5 \log_7(25)$ (b)  $3 \log_7(5)$ (c)  $(\log_7(5))^3$   $: \log_{\mathcal{F}}(5^3)$
