Section 4.4: Coordinate Systems

Given an ordered basis $\mathcal{B} = \{\mathbf{b}_1, \dots, \mathbf{b}_n\}$ for a vector space *V*, we noted that the coefficients in the linear combination $\mathbf{x} = c_1 \mathbf{b}_1 + \cdots + c_n \mathbf{b}_n$ are unique for a given **x**. This allows for an unambiguous definition of coordinate vectors.

Definition: Let $\mathcal{B} = {\mathbf{b}_1, ..., \mathbf{b}_n}$ be an **ordered** basis of the vector space *V*. For each **x** in *V* we define the **coordinate vector of x relative to the basis** \mathcal{B} to be the unique vector $(c_1, ..., c_n)$ in \mathbb{R}^n where these entries are the weights $\mathbf{x} = c_1 \mathbf{b}_1 + \cdots + c_n \mathbf{b}_n$.

We'll use the notation $[\mathbf{x}]_{\mathcal{B}}$ to denote such a coorindate vector.

For Example

For the elementary basis $\mathcal{B} = \{1, t, t^2, t^3\}$ (in that order) in \mathbb{P}_3 , a typical vector $\mathbf{p}(t) = p_0 + p_1 t + p_2 t^2 + p_3 t^3$ would have coordinate vector in \mathbb{R}^4 ,

$$[\mathbf{p}]_{\mathcal{B}} = \begin{bmatrix} p_0 \\ p_1 \\ p_2 \\ p_3 \end{bmatrix}$$

.

イロト イポト イヨト イヨト 一日

Coordinates in \mathbb{R}^n

Let $\mathcal{B} = {\mathbf{b}_1, \dots, \mathbf{b}_n}$ be an ordered basis of \mathbb{R}^n . Then the change of coordinate mapping $\mathbf{x} \mapsto [\mathbf{x}]_{\mathcal{B}}$ is the linear transformation defined by

$$[\mathbf{x}]_{\mathcal{B}} = P_{\mathcal{B}}^{-1}\mathbf{x}$$

where the matrix

$$P_{\mathcal{B}} = [\mathbf{b}_1 \quad \mathbf{b}_2 \quad \cdots \quad \mathbf{b}_n].$$

Theorem: Coordinate Mapping

Let $\mathcal{B} = {\mathbf{b}_1, ..., \mathbf{b}_n}$ be an ordered basis for a vector space *V*. Then the coordinate mapping $\mathbf{x} \mapsto [\mathbf{x}]_{\mathcal{B}}$ is a **one to one** mapping of *V* **onto** \mathbb{R}^n .

Remark: When such a mapping exists, we say that *V* is **isomorphic** to \mathbb{R}^n . Properties of subsets of *V*, such as linear dependence, can be discerned from the coordinate vectors in \mathbb{R}^n .

Use coordinate vectors to determine if the set $\{p, q, r\}$ is linearly dependent or independent in \mathbb{P}_2 .

$$\mathbf{p}(t) = 1 - 2t^{2}, \quad \mathbf{q}(t) = 3t + t^{2}, \quad \mathbf{r}(t) = 1 + t$$
We can use the elementary basis $\mathbf{B} = \{1, t, t^{2}\}.$

$$\begin{bmatrix} \vec{p} \end{bmatrix}_{\mathbf{B}} = \begin{bmatrix} 1 \\ 0 \\ -2 \end{bmatrix}, \quad \begin{bmatrix} \vec{q} \end{bmatrix}_{\mathbf{B}} = \begin{bmatrix} 0 \\ 2 \\ 1 \end{bmatrix}, \quad \begin{bmatrix} \vec{r} \end{bmatrix}_{\mathbf{B}} = \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}$$

$$\text{with 3 vectors in } \mathbf{R}^{3}, \text{ we can use a determinant.}$$

$$\text{Lt} \qquad \mathbf{A} = \begin{bmatrix} \begin{bmatrix} \vec{p} \end{bmatrix}_{\mathbf{B}} \quad \begin{bmatrix} \vec{q} \end{bmatrix}_{\mathbf{B}} \quad \begin{bmatrix} \vec{r} \end{bmatrix}_{\mathbf{B}} \end{bmatrix}$$

A D F A B F A B F A B F

$$= \begin{bmatrix} 1 & 0 & 1 \\ 0 & 3 & 1 \\ \cdot 2 & 1 & 0 \end{bmatrix}$$

$$det(A) = a_{11}C_{11} + a_{12}C_{11} + a_{13}C_{13}$$

$$= 1 \begin{vmatrix} 3 & 1 \\ 1 & 0 \end{vmatrix} + 0 \begin{vmatrix} \cdots & |+1 \end{vmatrix} \begin{vmatrix} 0 & 3 \\ -z & 1 \end{vmatrix}$$

$$= 1(-1) + 1(6) = 5 \neq 0$$
The columns of A one linearly independent.
Hence $\{\vec{p}, \vec{q}, \vec{r}\}$ is linearly independent.

Let *H* be the subset of $M^{2\times 2}$ of matrices of the form $\begin{bmatrix} a & -b \\ b & a \end{bmatrix}$.

(a) Show that *H* is a subspace of $M^{2\times 2}$ by finding a set *S* of vectors such that H = Span(S).

Let
$$\vec{u}$$
 by \vec{u} H, $\vec{u} = \begin{bmatrix} b & a \end{bmatrix}$ for some red \vec{u}, \vec{v} .
 $\vec{u} = a \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} + b \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$ A set S could be
 $S = \left\{ \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \right\}$

イロト イポト イヨト イヨト

(b) Demonstrate that the set S is a basis, or remove elements of S in order to obtain a basis \mathcal{B} for H.

Sis a basis. Note

$$C_{1} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} + C_{2} \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} \Rightarrow \begin{bmatrix} c_{1} - c_{2} \\ c_{2} & c_{1} \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} \Rightarrow (z = c_{2} = 0)$$
Hence S is linearly independent. S is a basis.

(c) Consider the mapping $\mathbf{x} \mapsto [\mathbf{x}]_{\mathcal{B}}$ for your basis. Determine *n* such that *H* is isomorphic to \mathbb{R}^n .

2 basis elements >> 2 coefficients. Hence N=2.

Section 4.5: Dimension of a Vector Space

Theorem: If a vector space *V* has a basis $\mathcal{B} = {\mathbf{b}_1, ..., \mathbf{b}_n}$, then any set of vectors in *V* containing *more than n vectors* is linearly dependent.

October 6, 2017 11 / 30

Dimension

Corollary: If vector space *V* has a basis $\mathcal{B} = {\mathbf{b}_1, ..., \mathbf{b}_n}$, then every basis of *V* consist of exactly *n* vectors.

Definition: If V is spanned by a finite set, then V is called **finite dimensional**. In this case, the dimension of V

 $\dim V =$ the number of vectors in any basis of V.

The dimension of the vector space $\{\mathbf{0}\}$ containing only the zero vector is defined to be zero—i.e.

$$\dim\{\mathbf{0}\}=0.$$

If V is not spanned by a finite set¹, then V is said to be **infinite** dimensional.

 $^{1}C^{0}(\mathbb{R})$ is an example of an infinite dimensional vector space $\mathbb{P} \to \mathbb{R} \to \mathbb{R}$

Examples (a) Find dim (\mathbb{R}^n) . $\dim(\mathbb{R}^n) = n$ The elementary basis has overtars $\vec{e}_{1,...,\vec{e}_n}$.

(b) Determine dim Col A where
$$A = \begin{bmatrix} 1 & 1 & 3 \\ 0 & 0 & -1 \end{bmatrix}$$
.

dim ColA = Z a basis is given by the set of pivot (dumns $\left\{ \begin{bmatrix} 1\\ 0 \end{bmatrix}, \begin{bmatrix} 3\\ -1 \end{bmatrix} \right\}$

Some Geometry in R³

Give a geometric description of subspaces of \mathbb{R}^3 of dimension (a) zero The spece is $\{\vec{0}\}$, the orgin (\circ, \circ, \circ) in \mathbb{R}^3 .

Must look Dive Span [ii], i + 0. Any line in R³ that passes through the origin. (b) one Must look like Spon Eti, v? with i, v Din, independent, (c) two Any place in R? that contains the origin. (d) three The only on is all of \mathbb{R}^3 .

Subspaces and Dimension

Theorem: Let H be a subspace of a finite dimensional vector space V. Then H is finite dimensional and

 $\dim H \leq \dim V$.

Moreover, any linearly independent subset of H can be expanded if needed to form a basis for H.

Theorem: Let *V* be a vector space with dim V = p where $p \ge 1$. Any linearly independent set in *V* containing exactly *p* vectors is a basis for *V*. Similarly, any spanning set consisting of exactly *p* vectors in *V* is necessarily a basis for *V*.

Column and Null Spaces

Theorem: Let *A* be an $m \times n$ matrix. Then

dim Nul*A* = the number of free variables in the equation $A\mathbf{x} = \mathbf{0}$, and dim Col*A* = the number of pivot positions in *A*.

October 6, 2017 16 / 30

< ロ > < 同 > < 回 > < 回 >

Find the dimensions of the null and columns spaces of the matrix A.

$$A = \begin{bmatrix} 1 & 1 & 1 & 0 \\ -3 & 1 & -7 & -1 \\ 3 & 0 & 6 & 1 \end{bmatrix}$$
 Use the ref

$$\xrightarrow{\text{(ref}} \begin{bmatrix} 1 & 0 & 2 & 0 \\ 0 & 1 & -1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$
There are 3 pivot positions in Columns 1,2, and 4.
From the cref, X3 would be the only
free variable.
