Section 13: The Laplace Transform

A quick word about functions of 2-variables:

Suppose G(s, t) is a function of two independent variables (*s* and *t*) defined over some rectangle in the plane $a \le t \le b$, $c \le s \le d$. If we compute an integral with respect to one of these variables, say *t*,

$$\int_{\alpha}^{\beta} G(s,t) \, dt$$

the result is a function of the remaining variable s, and

the variable s is treated as a constant while integrating with respect to t.

Integral Transform

.

An **integral transform** is a mapping that assigns to a function f(t) another function F(s) via an integral of the form

$$\int_a^b K(s,t)f(t)\,dt.$$

- ► The function *K* is called the **kernel** of the transformation.
- ► The limits *a* and *b* may be finite or infinite.
- The integral may be improper so that convergence/divergence must be considered.
- This transform is linear in the sense that

$$\int_a^b \mathcal{K}(s,t)(\alpha f(t) + \beta g(t)) \, dt = \alpha \int_a^b \mathcal{K}(s,t) f(t) \, dt + \beta \int_a^b \mathcal{K}(s,t) g(t) \, dt.$$

The Laplace Transform

Definition: Let f(t) be defined on $[0, \infty)$. The Laplace transform of f is denoted and defined by

$$\mathscr{L}{f(t)} = \int_0^\infty e^{-st} f(t) dt = F(s).$$

The domain of the transformation F(s) is the set of all *s* such that the integral is convergent.

Note: The kernel for the Laplace transform is $K(s, t) = e^{-st}$.

Note 2: If we take s to be real-valued, then

$$\lim_{t o \infty} e^{-st} = 0 \quad ext{if } s > 0, \ \ ext{and} \quad \lim_{t o \infty} e^{-st} = \infty \quad ext{if } s < 0.$$

Find the Laplace transform of f(t) = 1

$$\begin{aligned} &\mathcal{Y}\left\{f(U)\right\} = \mathcal{X}\left\{I\right\} = \int_{0}^{\infty} \frac{e^{st}}{e^{st}} \int_{0}^{t} dt \\ &\text{ we have to consider } s=0 \quad \text{separate from } s\neq0 \\ &\text{ Case 1 : } s=0 \quad , \text{ then } e^{-0t} = 1 \\ &\int_{0}^{\infty} 1 \ dt = \lim_{b \to \infty} \int_{0}^{b} dt = \lim_{b \to \infty} t \int_{0}^{b} = \lim_{b \to \infty} (b-0) = \lambda_{0} \\ &\text{ The integral is divergent } \text{ Zero is not in the } \\ &\text{ donain of } \mathcal{X}\left\{I\right\}. \end{aligned}$$

$$\begin{aligned} &\text{ Case 2 : } s\neq0 \quad \mathcal{Y}\left\{I\right\} = \int_{0}^{\infty} \frac{e^{-st}}{e^{-st}} dt = \lim_{b \to \infty} \int_{0}^{b} \frac{e^{-st}}{e^{-st}} dt \\ &\text{ box } \int_{0}^{b} \frac{e^{-st}}{e^{-st}} dt = \lim_{b \to \infty} \int_{0}^{b} \frac{e^{-st}}{e^{-st}} dt \\ &\text{ box } \int_{0}^{b} \frac{e^{-st}}{e^{-st}} dt = \int_{0}^{\infty} \frac{e^{-st}}{e^{-st}} dt \\ &\text{ box } \int_{0}^{b} \frac{e^{-st}}{e^{-st}} dt \\ &\text{ box } \int_{0}^{b} \frac{e^{-st}}{e^{-st}} dt \\ &\text{ box } \int_{0}^{b} \frac{e^{-st}}{e^{-st}} dt \\ &\text{ conditions } \frac{e^{-st}}{e^{-st}} dt \\ &\text{$$

$$=\frac{1}{5}\cdot 0 + \frac{1}{5} \quad \text{for } 5>0$$
$$=\frac{1}{5} \quad \text{for } 5>0$$
$$\text{So } \mathcal{Q}\left\{1\right\} = \frac{1}{5} \quad \text{with domain } 5>0$$

Find the Laplace transform of f(t) = t

$$\mathscr{L}{t} = \int_{0}^{\infty} e^{st} t dt$$

Case 1: S=0 the integral is $\int_{0}^{\infty} t dt = \frac{t^{2}}{2} \int_{0}^{\infty} = A_{0}$
The integral diverses

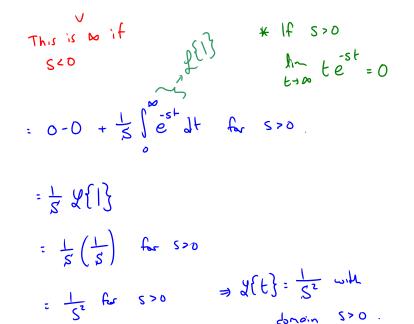

$$C_{osn 2}: S \neq 0$$

$$\chi\{t\} = \int_{0}^{\infty} e^{st} t dt$$

$$= \frac{-t}{5}e^{st} \left[\int_{0}^{\infty} - \int_{-\frac{1}{5}}^{-\frac{1}{5}} e^{st} dt \right]$$

$$\mathcal{Y}\left\{f(t)\right\}^{=} \begin{cases} 100 & , \ s=0 \\ \frac{2}{s^{2}} - \frac{2}{s^{2}} \frac{-10s}{c} - \frac{20}{s} \frac{-10s}{c} & , \ s\neq0 \end{cases}$$

The Laplace Transform is a Linear Transformation

Some basic results include:

$$\blacktriangleright \mathscr{L}\{\alpha f(t) + \beta g(t)\} = \alpha F(s) + \beta G(s)$$

•
$$\mathscr{L}{1} = \frac{1}{s}, \quad s > 0$$

•
$$\mathscr{L}$$
{ t^n } = $\frac{n!}{s^{n+1}}$, $s > 0$ for $n = 1, 2, ...$

•
$$\mathscr{L}{e^{at}} = \frac{1}{s-a}, \quad s > a$$

•
$$\mathscr{L}\{\cos kt\} = \frac{s}{s^2 + k^2}, \quad s > 0$$

•
$$\mathscr{L}{ {\sin kt}} = \frac{k}{s^2 + k^2}, \quad s > 0$$
