Section 2.2: Inverse of a Matrix

If A is an $n \times n$ matrix, we seek a matrix A^{-1} that satisfies the condition

$$A^{-1}A = AA^{-1} = I_n.$$

If such matrix A^{-1} exists, we'll say that A is **nonsingular** (a.k.a. *invertible*). Otherwise, we'll say that A is **singular**.

Theorem (2 × 2 case)

Let $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$. If $ad - bc \neq 0$, then A is invertible and

$$A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}.$$

If $ad - bc = 0$, then A is singular.

$\det(A) = ad - bc$

The quantity $ad - bc$ is called the **determinant** of A.

Theorem: If A is an invertible $n \times n$ matrix, then for each **b** in $\mathbb{R}^n$, the equation $A\mathbf{x} = \mathbf{b}$ has unique solution $\mathbf{x} = A^{-1}\mathbf{b}$.

Example

Solve the system using a matrix inverse

$$\begin{array}{rcrcl} 4x_1 & + & x_2 & = & 7 \\ -2x_1 & + & 3x_2 & = & 7 \end{array}$$

$$\begin{bmatrix} 4 & 1 \\ -2 & 3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 7 \\ 7 \end{bmatrix}$$

Coefficient matrix

$$A = \begin{bmatrix} 4 & 1 \\ -2 & 3 \end{bmatrix}$$

$$\det(A) = 4 \cdot 3 - (-2) \cdot 1 = 14 \neq 0$$

$$A^{-1} \text{ exists}$$

$$A^{-1} = \frac{1}{14} \begin{bmatrix} 3 & -1 \\ 2 & 4 \end{bmatrix}$$

the
Solution

$$\vec{x} = A^{-1}b = \frac{1}{14}\begin{bmatrix} 3 & -1 \\ 2 & 4 \end{bmatrix}\begin{bmatrix} 7 \\ 7 \end{bmatrix}$$

$$= \frac{1}{14}\begin{bmatrix} 14 \\ 42 \end{bmatrix} = \begin{bmatrix} 1 \\ 3 \end{bmatrix}$$

Theorem

(i) If A is invertible, then A^{-1} is also invertible and

$$\left(A^{-1}\right)^{-1} = A.$$

(ii) If A and B are invertible $n \times n$ matrices, then the product AB is also invertible[1] with

$$(AB)^{-1} = B^{-1}A^{-1}.$$

(iii) If A is invertible, then so is A^T. Moreover

$$\left(A^T\right)^{-1} = \left(A^{-1}\right)^T.$$

---

[1] This can generalize to the product of k invertible matrices.

Elementary Matrices

Definition: An **elementary** matrix is a square matrix obtained from the identity by performing one elementary row operation.

Examples:

$$E_1 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 1 \end{bmatrix}, \quad E_2 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 2 & 0 & 1 \end{bmatrix}, \quad E_3 = \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}.$$

$$3R_2 \to R_2 \qquad 2R_1 + R_3 \to R_3 \qquad R_1 \leftrightarrow R_2$$

Action of Elementary Matrices

Let $A = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix}$, and compute the following products

$$E_1 A, \quad E_2 A, \quad \text{and} \quad E_3 A.$$

$$E_1 A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix} = \begin{bmatrix} a & b & c \\ 3d & 3e & 3f \\ g & h & i \end{bmatrix}$$

$$3R_2 \to R_2$$

$E_1 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

$$E_2 A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 2 & 0 & 1 \end{bmatrix} \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix}$$

$$= \begin{bmatrix} a & b & c \\ d & e & f \\ 2a+g & 2b+h & 2c+i \end{bmatrix}$$

$$2R_1 + R_3 \to R_3$$

$E_2 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 2 & 0 & 1 \end{bmatrix}$

$$E_3 A = \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix}$$

$$= \begin{bmatrix} d & e & f \\ a & b & c \\ g & h & i \end{bmatrix}$$

$$R_1 \leftrightarrow R_2$$

$$E_3 = \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Remarks

- Elementary row operations can be equated with matrix multiplication (multiply on the left by an elementary matrix),

- Each elementary matrix is invertible where the inverse *undoes* the row operation,

- Reduction to rref is a sequence of row operations, so it is a sequence of matrix multiplications

$$\text{rref}(A) = E_k \cdots E_2 E_1 A.$$

Theorem

An $n \times n$ matrix A is invertible if and only if it is row equivalent to the identity matrix I_n. Moreover, if

$$\text{rref}(A) = E_k \cdots E_2 E_1 A = I_n, \quad \text{then} \quad A = (E_k \cdots E_2 E_1)^{-1} I_n.$$

That is,

$$A^{-1} = \left[(E_k \cdots E_2 E_1)^{-1} \right]^{-1} = E_k \cdots E_2 E_1.$$

The sequence of operations that reduces A to I_n, transforms I_n into A^{-1}.

This last observation—operations that take A to I_n also take I_n to A^{-1}—gives us a method for computing an inverse!

Algorithm for finding A^{-1}

To find the inverse of a given matrix A:

- Form the $n \times 2n$ augmented matrix $[A \quad I]$.
- Perform whatever row operations are needed to get the first n columns (the A part) to rref.
- If rref(A) is I, then $[A \quad I]$ is row equivalent to $[I \quad A^{-1}]$, and the inverse A^{-1} will be the last n columns of the reduced matrix.
- If rref(A) is NOT I, then A is not invertible.

Remarks: We don't need to know ahead of time if A is invertible to use this algorithm.

If A is singular, we can stop as soon as it's clear that rref(A) $\neq I$.

Examples: Find the Inverse if Possible

(a)
$$\begin{bmatrix} 1 & 2 & -1 \\ -4 & -7 & 3 \\ -2 & -6 & 4 \end{bmatrix} = A$$

$$\left[\begin{array}{ccc|ccc} 1 & 2 & -1 & 1 & 0 & 0 \\ -4 & -7 & 3 & 0 & 1 & 0 \\ -2 & -6 & 4 & 0 & 0 & 1 \end{array}\right]$$

$$\begin{array}{cccccc} 4 & 8 & -4 & 4 & 0 & 0 \\ -4 & -7 & 3 & 0 & 1 & 0 \end{array}$$

$4R_1 + R_2 \rightarrow R_2$

$2R_1 + R_3 \rightarrow R_3$

$$\begin{array}{cccccc} 2 & 4 & -2 & 2 & 0 & 0 \\ -2 & -6 & 4 & 0 & 0 & 1 \end{array}$$

$$\left[\begin{array}{ccc|ccc} 1 & 2 & -1 & 1 & 0 & 0 \\ 0 & 1 & -1 & 4 & 1 & 0 \\ 0 & -2 & 2 & 2 & 0 & 1 \end{array}\right]$$

$$2R_2 + R_3 \rightarrow R_3$$

0 2 -2 8 2 0
0 -2 2 2 0 1

$$\begin{bmatrix} 1 & 2 & -1 & 1 & 0 & 0 \\ 0 & 1 & -1 & 4 & 1 & 0 \\ 0 & 0 & 0 & 10 & 2 & 1 \end{bmatrix}$$

The (3,3) position cannot be a pivot position.

Hence   rref (A) ≠ I.

A is singular.

Examples: Find the Inverse if Possible

(b) $\begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 4 \\ 5 & 6 & 0 \end{bmatrix} = A$

$$\left[\begin{array}{ccc|ccc} 1 & 2 & 3 & 1 & 0 & 0 \\ 0 & 1 & 4 & 0 & 1 & 0 \\ 5 & 6 & 0 & 0 & 0 & 1 \end{array}\right]$$

$$-5R_1 + R_3 \to R_3$$

$$\begin{array}{cccccc} -5 & -10 & -15 & -5 & 0 & 0 \\ 5 & 6 & 0 & 0 & 0 & 1 \end{array}$$

$$\left[\begin{array}{ccc|ccc} 1 & 2 & 3 & 1 & 0 & 0 \\ 0 & 1 & 4 & 0 & 1 & 0 \\ 0 & -4 & -15 & -5 & 0 & 1 \end{array}\right]$$

$$4R_2 + R_3 \to R_3$$

$$\begin{array}{cccccc} 0 & 4 & 16 & 0 & 4 & 0 \\ 0 & -4 & -15 & -5 & 0 & 1 \end{array}$$

$$\begin{bmatrix} 1 & 2 & 3 & 1 & 0 & 0 \\ 0 & 1 & 4 & 0 & 1 & 0 \\ 0 & 0 & 1 & -5 & 4 & 1 \end{bmatrix}$$

$-4R_3 + R_2 \to R_2$

$-3R_3 + R_1 \to R_1$

$$\begin{array}{cccccc} 0 & 0 & -4 & 20 & -16 & -4 \\ 0 & 1 & 4 & 0 & 1 & 0 \end{array}$$

$$\begin{array}{cccccc} 0 & 0 & -3 & 15 & -12 & -3 \\ 1 & 2 & 3 & 1 & 0 & 0 \end{array}$$

$$\begin{bmatrix} 1 & 2 & 0 & 16 & -12 & -3 \\ 0 & 1 & 0 & 20 & -15 & -4 \\ 0 & 0 & 1 & -5 & 4 & 1 \end{bmatrix}$$

$-2R_2 + R_1 \to R_1$

$$\begin{array}{cccccc} 0 & -2 & 0 & -40 & 30 & 8 \\ 1 & 2 & 0 & 16 & -12 & -3 \end{array}$$

$$\begin{bmatrix} 1 & 0 & 0 & -24 & 18 & 5 \\ 0 & 1 & 0 & 20 & -15 & -4 \\ 0 & 0 & 1 & -5 & 4 & 1 \end{bmatrix}$$

$$\underbrace{}_{\text{rref}(A)} \quad \underbrace{}_{A^{-1}}$$

A is invertible $\qquad A^{-1} = \begin{bmatrix} -24 & 18 & 5 \\ 20 & -15 & -4 \\ -5 & 4 & 1 \end{bmatrix}$

Solve the linear system if possible

$$
\begin{array}{rcrcrcl}
x_1 & + & 2x_2 & + & 3x_3 & = & 3 \\
    &   & x_2 & + & 4x_3 & = & 3 \\
5x_1 & + & 6x_2 & & & = & 4
\end{array}
$$

$$
\begin{bmatrix} 1 & 2 & 3 \\ 0 & 1 & 4 \\ 5 & 6 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 3 \\ 3 \\ 4 \end{bmatrix}
$$

The coefficient matrix is from the last example

$$
\vec{x} = A^{-1} \vec{b}
$$

$$\tilde{X} = \begin{bmatrix} -24 & 18 & 5 \\ 20 & -15 & -4 \\ -5 & 4 & 1 \end{bmatrix} \begin{bmatrix} 3 \\ 3 \\ 4 \end{bmatrix} = \begin{bmatrix} 2 \\ -1 \\ 1 \end{bmatrix}$$

$-24 \cdot 3 + 18 \cdot 3 + 5 \cdot 4$

$20 \cdot 3 + (-15) \cdot 3 - 4 \cdot 4$
