

## Section 3.1: Introduction to Determinants

Let  $n \geq 2$ . For an  $n \times n$  matrix  $A$ , let  $A_{ij}$  denote the  $(n-1) \times (n-1)$  matrix obtained from  $A$  by deleting the  $i^{\text{th}}$  row and the  $j^{\text{th}}$  column of  $A$ .

**Definition: Minor** The  $i, j^{\text{th}}$  **minor** of the  $n \times n$  matrix  $A$  is the number

$$M_{ij} = \det(A_{ij}).$$

**Definition: Cofactor** Let  $A$  be an  $n \times n$  matrix with  $n \geq 2$ . The  $i, j^{\text{th}}$  **cofactor** of  $A$  is the number

$$C_{ij} = (-1)^{i+j} M_{ij}.$$

## Example

Find the three minors  $M_{11}$ ,  $M_{12}$ ,  $M_{13}$  and find the 3 cofactors  $C_{11}$ ,  $C_{12}$ ,  $C_{13}$  of the matrix

$$A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}. \quad A_{11} = \begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix}$$

$$M_{11} = \det(A_{11}) = a_{22} a_{33} - a_{32} a_{23}$$

$$C_{11} = (-1)^{1+1} M_{11} = M_{11} = a_{22} a_{33} - a_{32} a_{23}$$

$$A_{12} = \begin{bmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{bmatrix} \quad M_{12} = \det(A_{12}) = a_{21} a_{33} - a_{31} a_{23}$$
$$C_{12} = (-1)^{1+2} M_{12} = - (a_{21} a_{33} - a_{31} a_{23})$$

## (Example Continued...)

$$A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}. \quad A_{13} = \begin{bmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{bmatrix}$$

$$M_{13} = \det(A_{13}) = a_{21} a_{32} - a_{31} a_{22}$$

$$C_{13} = (-1)^{1+3} M_{13} = a_{21} a_{32} - a_{31} a_{22}$$

## Observation:

Comparison with the determinant of the  $3 \times 3$  matrix, we can note that

$$\begin{aligned}\Delta &= a_{11}\det\begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix} - a_{12}\det\begin{bmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{bmatrix} + a_{13}\det\begin{bmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{bmatrix} \\ &= a_{11}C_{11} + a_{12}C_{12} + a_{13}C_{13}\end{aligned}$$

## Definition: Determinant

For  $n \geq 2$ , the **determinant** of the  $n \times n$  matrix  $A = [a_{ij}]$  is the number

$$\begin{aligned}\det(A) &= a_{11}C_{11} + a_{12}C_{12} + \cdots + a_{1n}C_{1n} \\ &= \sum_{j=1}^n (-1)^{1+j} a_{1j} M_{1j}\end{aligned}$$

(We'll call such a sum a **cofactor expansion**.)

## Example: Evaluate the determinant

$$A = \begin{bmatrix} -1 & 3 & 0 \\ -2 & 1 & 2 \\ 3 & 0 & 6 \end{bmatrix}$$

$$\begin{aligned} \det(A) &= a_{11} C_{11} + a_{12} C_{12} + a_{13} C_{13} \\ &= (-1) \det \left( \begin{bmatrix} 1 & 2 \\ 0 & 6 \end{bmatrix} \right) - 3 \det \left( \begin{bmatrix} -2 & 2 \\ 3 & 6 \end{bmatrix} \right) + 0 \det \left( \begin{bmatrix} -2 & 1 \\ 3 & 0 \end{bmatrix} \right) \\ &= -6 - 3(-18) + 0 = -6 + 54 = 48 \end{aligned}$$

## Theorem:

The determinant of an  $n \times n$  matrix can be computed by cofactor expansion across any row or down any column.

**Example:** Find the determinant of the matrix

$$A = \begin{bmatrix} -1 & 3 & 4 & 0 \\ 0 & 0 & -3 & 0 \\ -2 & 1 & 2 & 2 \\ 3 & 0 & -1 & 6 \end{bmatrix}$$

We'll do a cofactor expansion across row 2.

$$\det(A) = \underbrace{a_{21}}_{0''} C_{21} + \underbrace{a_{22}}_{0''} C_{22} + a_{23} C_{23} + \underbrace{a_{24}}_{0''} C_{24}$$

$$C_{23} = (-1)^{2+3} M_{23} = (-1) \det \left( \begin{bmatrix} -1 & 3 & 0 \\ -2 & 1 & 2 \\ 3 & 0 & 6 \end{bmatrix} \right) = (-1) 48 = -48$$

$$\det(A) = (-3)(-48) = 144$$

# Triangular Matrices

## Definition:

The  $n \times n$  matrix  $A = [a_{ij}]$  is said to be **upper triangular** if  $a_{ij} = 0$  for all  $i > j$ . It is said to be **lower triangular** if  $a_{ij} = 0$  for all  $j > i$ . A matrix that is both upper and lower triangular is **diagonal**.

**Theorem:** For  $n \geq 2$ , the determinant of an  $n \times n$  triangular matrix is the product of its diagonal entries. (i.e. if  $A = [a_{ij}]$  is triangular, then  $\det(A) = a_{11}a_{22} \cdots a_{nn}$ .)

## Example

$$A = \begin{bmatrix} -1 & 3 & 4 & 0 & 2 \\ 0 & 2 & -3 & 0 & -4 \\ 0 & 0 & 3 & 7 & 5 \\ 0 & 0 & 0 & -4 & 6 \\ 0 & 0 & 0 & 0 & 6 \end{bmatrix}$$

$$\det(A) = (-1) \cdot 2 \cdot 3 \cdot (-4) \cdot 6 \\ = 144$$

$$A = \begin{bmatrix} 7 & 0 & 0 & 0 \\ 3 & 6 & 0 & 0 \\ 0 & -1 & 2 & 0 \\ 4 & 2 & 2 & 2 \end{bmatrix}$$

$$\det(A) = 7 \cdot 6 \cdot 2 \cdot 2 = 168$$

## Section 3.2: Properties of Determinants

**Theorem:** Let  $A$  be an  $n \times n$  matrix, and suppose the matrix  $B$  is obtained from  $A$  by performing a single elementary row operation<sup>1</sup>. Then

- (i) If  $B$  is obtained by adding a multiple of a row of  $A$  to another row of  $A$  (row replacement), then

$$\det(B) = \det(A).$$

- (ii) If  $B$  is obtained from  $A$  by swapping any pair of rows (row swap), then

$$\det(B) = -\det(A).$$

- (iii) If  $B$  is obtained from  $A$  by scaling any row by the constant  $k$  (scaling), then

$$\det(B) = k\det(A).$$

---

<sup>1</sup> If "row" is replaced by "column" in any of the operations, the conclusions still follow. ↻

## Example: Compute the Determinant

$$\begin{vmatrix} 0 & 1 & 2 & -1 \\ 2 & 5 & -7 & 3 \\ 0 & 3 & 6 & 2 \\ -2 & -5 & 4 & -2 \end{vmatrix}$$

$$R_1 \leftrightarrow R_2$$

$$\begin{bmatrix} 2 & 5 & -7 & 3 \\ 0 & 1 & 2 & -1 \\ 0 & 3 & 6 & 2 \\ -2 & -5 & 4 & -2 \end{bmatrix}$$

$$R_1 + R_4 \rightarrow R_4$$

Let's create an echelon form  
and find the determinant  
from it.

Changes

swap -1

replace no effect

replace no effect

Swap -1

$$\begin{bmatrix} 2 & 5 & -7 & 3 \\ 0 & 1 & 2 & -1 \\ 0 & 3 & 6 & 2 \\ 0 & 0 & -3 & 1 \end{bmatrix}$$

$$-3R_2 + R_3 \rightarrow R_3$$

$$\begin{bmatrix} 2 & 5 & -7 & 3 \\ 0 & 1 & 2 & -1 \\ 0 & 0 & 0 & 5 \\ 0 & 0 & -3 & 1 \end{bmatrix}$$

$$R_3 \leftrightarrow R_4$$

$$\begin{bmatrix} 2 & 5 & -7 & 3 \\ 0 & 1 & 2 & -1 \\ 0 & 0 & -3 & 1 \\ 0 & 0 & 0 & 5 \end{bmatrix}$$

If this is  $\beta$  then

$$\begin{aligned} \det(\beta) &= 2 \cdot 1 \cdot (-3) \cdot 5 \\ &= -30 \end{aligned}$$

For our original matrix  $A$

$$\det(A) = \frac{\det(\beta)}{(-1)(-1)} = -30$$

## Some Theorems:

**Theorem:** The  $n \times n$  matrix  $A$  is invertible if and only if  $\det(A) \neq 0$ .

**Theorem:** For  $n \times n$  matrix  $A$ ,  $\det(A^T) = \det(A)$ .

**Theorem:** For  $n \times n$  matrices  $A$  and  $B$ ,  $\det(AB) = \det(A) \det(B)$ .

## Example

Show that if  $A$  is an  $n \times n$  invertible matrix, then

$$\det(A^{-1}) = \frac{1}{\det(A)}.$$

$$A \text{ invertible} \Rightarrow \det(A) \neq 0. \quad \text{Note } \det(I_n) = 1$$

$$I = A A^{-1} \Rightarrow \det(I) = \det(A A^{-1}) = \det(A) \det(A^{-1})$$

$$\text{Hence } 1 = \det(A) \det(A^{-1})$$

$$\text{so } \frac{1}{\det(A)} = \det(A^{-1})$$

## Example

Let  $A$  be an  $n \times n$  matrix, and suppose there exists invertible matrix  $P$  such that

$$B = P^{-1}AP.$$

Show that

$$\det(B) = \det(A).$$

$$\det(B) = \det(P^{-1}AP) = \det(P^{-1}) \det(AP) = \underbrace{\det(P^{-1}) \det(P)}_{\text{Scalars}} \det(A)$$

$$\text{So } \det(B) = \underbrace{\det(P^{-1}) \det(P)}_{1} \det(A)$$

$$\Rightarrow \det(B) = \det(A).$$

## Section 4.1: Vector Spaces and Subspaces

**Definition** A **vector space** is a nonempty set  $V$  of objects called *vectors* together with two operations called *vector addition* and *scalar multiplication* that satisfy the following ten axioms: For all  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  in  $V$ , and for any scalars  $c$  and  $d$

1. The sum  $\mathbf{u} + \mathbf{v}$  of  $\mathbf{u}$  and  $\mathbf{v}$  is in  $V$ .
2.  $\mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u}$ .
3.  $(\mathbf{u} + \mathbf{v}) + \mathbf{w} = \mathbf{u} + (\mathbf{v} + \mathbf{w})$ .
4. There exists a **zero** vector  $\mathbf{0}$  in  $V$  such that  $\mathbf{u} + \mathbf{0} = \mathbf{u}$ .
5. For each vector  $\mathbf{u}$  there exists a vector  $-\mathbf{u}$  such that  $\mathbf{u} + (-\mathbf{u}) = \mathbf{0}$ .
6. For each scalar  $c$ ,  $c\mathbf{u}$  is in  $V$ .
7.  $c(\mathbf{u} + \mathbf{v}) = c\mathbf{u} + c\mathbf{v}$ .
8.  $(c + d)\mathbf{u} = c\mathbf{u} + d\mathbf{u}$ .
9.  $c(d\mathbf{u}) = d(c\mathbf{u}) = (cd)\mathbf{u}$ .
10.  $1\mathbf{u} = \mathbf{u}$

## Remarks

- ▶  $V$  is more accurately called a *real vector space* when we assume that the relevant scalars are the real numbers.
- ▶ Property 1. is that  $V$  is **closed** under (a.k.a. with respect to) **vector addition**.
- ▶ Property 6. is that  $V$  is **closed** under **scalar multiplication**.
- ▶ A vector space has the same basic *structure* as  $\mathbb{R}^n$
- ▶ These are **axioms**. We assume (not "prove") that they hold for vector space  $V$ . However, they can be used to **prove or disprove** that a given set (with operations) is actually a vector space.

# Examples of Vector Spaces

For an integer  $n \geq 0$ ,  $\mathbb{P}_n$  denotes the set of all polynomials with real coefficients of degree at most  $n$ . That is

$$\mathbb{P}_n = \{\mathbf{p}(t) = p_0 + p_1 t + \cdots + p_n t^n \mid p_0, p_1, \dots, p_n \in \mathbb{R}\},$$

where addition<sup>2</sup> and scalar multiplication are defined by

$$(\mathbf{p} + \mathbf{q})(t) = \mathbf{p}(t) + \mathbf{q}(t) = (p_0 + q_0) + (p_1 + q_1)t + \cdots + (p_n + q_n)t^n,$$

$$(c\mathbf{p})(t) = c\mathbf{p}(t) = cp_0 + cp_1 t + \cdots + cp_n t^n.$$

---

<sup>2</sup> $\mathbf{q}(t) = q_0 + q_1 t + \cdots + q_n t^n$

## Example

What is the zero vector  $\mathbf{0}$  in  $\mathbb{P}_n$ ?

We need  $\vec{0} + \vec{p} = \vec{p}$  for each  $\vec{p}$  in  $\mathbb{P}_n$ .

$$\text{Let } \vec{0} = a_0 + a_1 t + \dots + a_n t^n$$

$$\begin{aligned} (\vec{0} + \vec{p})(t) &= \vec{0}(t) + \vec{p}(t) = (a_0 + p_0) + (a_1 + p_1)t + \dots + (a_n + p_n)t^n \\ &= p_0 + p_1 t + p_2 t^2 + \dots + p_n t^n \end{aligned}$$

This requires  $a_0 = a_1 = \dots = a_n = 0$

$$\text{So } \vec{0} = 0 + 0t + 0t^2 + \dots + 0t^n = 0.$$

## Example

If  $\mathbf{p}(t) = p_0 + p_1 t + \dots + p_n t^n$ , what is the vector  $-\mathbf{p}$ ?

We need  $\vec{p} + (-\vec{p}) = \vec{0}$

Let  $-\vec{p} = b_0 + b_1 t + b_2 t^2 + \dots + b_n t^n$

Then  $(\vec{p} + (-\vec{p}))(t) = \vec{p}(t) + (-\vec{p})(t)$   
 $= (p_0 + b_0) + (p_1 + b_1)t + \dots + (p_n + b_n)t^n$

We need  $p_i + b_i = 0$  for each  $i = 0, \dots, n$

so  $b_i = -p_i$

$$-\vec{p}(t) = -p_0 - p_1 t - \dots - p_n t^n$$

# Examples of Vector Spaces

Let  $V$  be the set of all differentiable, real valued functions  $f(x)$  defined for  $-\infty < x < \infty$  with the property that

$$f(0) = 0.$$

Define vector addition and scalar multiplication in the standard way for functions—i.e.

$$(f + g)(x) = f(x) + g(x), \quad \text{and} \quad (cf)(x) = cf(x).$$

## Example

Verify that properties 1. and 6. hold.

If  $f$  and  $g$  are differentiable, then  $f+g$  and  $cf$  are differentiable.

Suppose  $f$  and  $g$  are in our space so that  $f(0) = 0$  and  $g(0) = 0$ .

Then  $(f+g)(0) = f(0) + g(0) = 0 + 0 = 0$ .

So the set is closed under vector addition.

Also  $(cf)(0) = cf(0) = c \cdot 0 = 0$

Hence the set is closed under  
Scalar multiplication.

## A set that is not a Vector Space

Let  $V = \left\{ \begin{bmatrix} x \\ y \end{bmatrix}, \mid x \leq 0, y \leq 0 \right\}$  with regular vector addition and scalar multiplication in  $\mathbb{R}^2$ . Note  $V$  is the third quadrant in the  $xy$ -plane.

(1) Does property 1. hold for  $V$ ?

Suppose  $\begin{bmatrix} x \\ y \end{bmatrix}, \begin{bmatrix} u \\ v \end{bmatrix}$  are in  $V$  so that  $x \leq 0, y \leq 0,$   
 $u \leq 0, v \leq 0$

$$\begin{bmatrix} x \\ y \end{bmatrix} + \begin{bmatrix} u \\ v \end{bmatrix} = \begin{bmatrix} x+u \\ y+v \end{bmatrix} \quad \text{But } x+u \leq 0$$

and  $y+v \leq 0$

so this is in  $V$ .

$V$  is closed under this addition.

## A set that is not a Vector Space

Let  $V = \left\{ \begin{bmatrix} x \\ y \end{bmatrix}, \mid x \leq 0, y \leq 0 \right\}$  with regular vector addition and scalar multiplication in  $\mathbb{R}^2$ . Note  $V$  is the third quadrant in the  $xy$ -plane.

(2) Does property 6. hold for  $V$ ?

No. Note  $\begin{bmatrix} -1 \\ -1 \end{bmatrix}$  is in  $V$  but

$$(-1) \begin{bmatrix} -1 \\ -1 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix} \text{ is not in } V.$$

$V$  is not closed under scalar multiplication.
