April 12 Math 3260 sec. 51 Spring 2024 Section 5.3: Diagonalization

Definition:

Two $n \times n$ matrices *A* and *B* are said to be **similar** if there exists an invertible matrix *P* such that

$$B=P^{-1}AP.$$

The mapping $A \mapsto P^{-1}AP$ is called a **similarity transformation**.

If A and B are similar, they have the same characteristic equation and hence the same eigenvalues.

► If
$$B = P^{-1}AP$$
 for $n \times n$ matrices A , B , and P , then $B^k = P^{-1}A^kP$ for each integer $k \ge 1$.

Diagonalizability

Defintion:

An $n \times n$ matrix A is called **diagonalizable** if it is similar to a diagonal matrix D. That is, provided there exists a nonsingular matrix P such that $D = P^{-1}AP$ —i.e. $A = PDP^{-1}$.

Theorem:

The $n \times n$ matrix A is diagonalizable if and only if A has n linearly independent eigenvectors. In this case, the matrix P is the matrix whose columns are the n linearly independent eigenvectors of A.

Example

Diagonalize the matrix A if possible.
$$A = \begin{bmatrix} 1 & 3 & 3 \\ -3 & -5 & -3 \\ 3 & 3 & 1 \end{bmatrix}$$

We found that the characteristic polynomial for A was $(1 - \lambda)(\lambda + 2)^2$ giving two distinct eigenvalues,

 $\lambda_1 = 1$, and $\lambda_2 = \lambda_3 = -2$.

We found three linearly independent eigenvectors

$$\mathbf{v}_1 = \begin{bmatrix} 1\\ -1\\ 1 \end{bmatrix}, \quad \mathbf{v}_2 = \begin{bmatrix} -1\\ 1\\ 0 \end{bmatrix}, \text{ and } \mathbf{v}_3 = \begin{bmatrix} -1\\ 0\\ 1 \end{bmatrix}$$

Then $D = P^{-1}AP$ where

April 10, 2024 3/37

Example

Diagonalize the matrix A if possible. $A = \begin{bmatrix} 2 & 4 & 3 \\ -4 & -6 & -3 \\ 3 & 3 & 1 \end{bmatrix}$. (With a little effort, it can be shown that the characteristic polynomial of A is $(1-\lambda)(2+\lambda)^2$.)

From the Characteristic poly, the dismutates
are
$$\lambda_1 = 1$$
 and $\lambda_2 = \lambda_3 = -2$.
Find eigenvectors for $\lambda_1 = 1$.
Solve $(A - 1I)\vec{X} = \vec{0}$.
 $A - 1I = \begin{bmatrix} 1 & 4 & 3 \\ -4 & -7 & -3 \\ 3 & 3 & 0 \end{bmatrix}$ met $\begin{bmatrix} 1 & 0 & -1 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{bmatrix} \begin{pmatrix} X_1 = X_2 \\ Y_2 = Y_3 \\ Y_3 = Y_3 \\ Y_4 = Y_4 \end{bmatrix}$

April 10, 2024 4/37

$$\vec{X} = X_3 \begin{bmatrix} -1 \\ -1 \end{bmatrix} \quad \text{Let} \quad \vec{V}_1 = \begin{bmatrix} -1 \\ -1 \end{bmatrix} .$$

Find eigenvectors for $\lambda_2 = \lambda_3 = -2$

$$A - (-z)T = \begin{bmatrix} 4 & 4 & 3 \\ -4 & -4 & -3 \\ 3 & 3 & 3 \end{bmatrix} \xrightarrow{\text{creet}} \begin{bmatrix} 1 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix} X_2 = X_2 \cdot X_2$$

April 10, 2024 5/37

So A is not diagonalizable.

Sufficient Condition for Diagonalizability

Recall: Eigenvectors corresponding to different eigenvalues are linearly independent.

Theorem:

If the $n \times n$ matrix A has n distinct eigenvalues, then A is diagonalizable.

Remark

This is a *sufficiency* condition, not a *necessity* condition. This means that if a matrix has *n* different eigenvalues, it's guaranteed to be diagonalizable. If it has repeated eigenvalues, it may or may not be diagonalizable.

More on Diagonalizability

Theorem:

- Let *A* be an $n \times n$ matrix with distinct eigenvalues $\lambda_1, \ldots, \lambda_p$.
 - (a) The geometric multiplicity of λ_k is less than or equal to the algebraic multiplicity of λ_k .
 - (b) The matrix is diagonalizable if and only if the sum of the geometric multiplicities is *n*.
 - (c) If A is diagonalizable, and B_k is a basis for the eigenspace for λ_k, then the collection (union) of bases B₁,..., B_p is a basis for ℝⁿ.

Remark: The union of the bases referred to in part (c) is called an **eigenvector basis** of \mathbb{R}^n for the matrix *A*. This is what was called an **eigenbasis** in the 3Blue 1Brown video.

< ロ > < 同 > < 回 > < 回 >

Example

Diagonalize the matrix if possible. $A = \begin{bmatrix} 8 & -6 \\ 9 & -7 \end{bmatrix}$.

Characteristic egn 72=-1 $\lambda_1 = Z$ $\lambda^2 - \lambda - Z = 0$ For $\lambda_1 = 2$, an eigenvector is $\vec{\chi} = \chi_2 \begin{bmatrix} 1 \end{bmatrix}$ $Q_{i} = \left[\begin{array}{c} 1 \\ 1 \end{array} \right],$ $\begin{array}{c} \chi_{1} = \frac{2}{3}\chi_{2} \\ \chi_{2} = \chi_{2} \\ \chi_{1} = \chi_{2} \\ \chi_{2} \end{array}$ For $\lambda_z = -1$ Let $\vec{V}_2 = \begin{pmatrix} 2 \\ 3 \end{pmatrix}$ by letting $\chi_2 = 3$. < ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

11/37

Letting
$$P = \begin{bmatrix} \nabla_1 & \nabla_2 \end{bmatrix} = \begin{bmatrix} 1 & 2 \\ 1 & 3 \end{bmatrix} dd(P) = 1$$

Then $P' = \frac{1}{1} = \begin{bmatrix} 3 & -2 \\ -1 & 1 \end{bmatrix} = \begin{bmatrix} 3 & -2 \\ -1 & 1 \end{bmatrix}$
 $D = P'AP = \begin{bmatrix} 3 & -2 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} 8 & -6 \\ 9 & -7 \end{bmatrix} \begin{bmatrix} 1 & 2 \\ 1 & 3 \end{bmatrix}$
 $= \begin{bmatrix} 2 & 0 \\ 0 & -1 \end{bmatrix}$.
Mode : we can use any eigenvector for $\lambda_2 = -1$.
So it's correct to use $\begin{bmatrix} 2/3 \\ 1 \end{bmatrix} \text{ or } \begin{bmatrix} 2 \\ 3 \end{bmatrix}$. Our choice.

+
