Section 3: Separation of Variables

Recall that a first order ODE is called separable if it has the form

$$\frac{dy}{dx} = g(x)h(y).$$

Such an equation is solved by separating the variables.

$$\int \frac{dy}{h(y)} = \int g(x) \, dx$$

We can also look for possible constant solutions to the separable ODE by trying to solve the equation

$$h(y)=0.$$

August 25, 2021

Caveat regarding division by h(y).

The IVP
$$\frac{dy}{dx} = x\sqrt{y}, \quad y(0) = 0$$

has two solutions

$$y(x) = \frac{x^4}{16}$$
 and $y(x) = 0$.

The solution $y = x^4/16$ can be obtained by separation of variables. The constant solution y(x) = 0 **cannot**!

August 25, 2021

Example

In Class Exercise: Take a few minutes and solve the ODE

$$\frac{dy}{dx} = x\sqrt{y}$$

by separating the variables.

If you finish early, try imposing the condition y(0=0. N = X $\int y'^2 dy = \int x dx$ 50/0 20 $2\overline{5} = \frac{x^2}{2} + C$ 1. mpticit forming August 25, 2021

y(x)=0 also solver dy = xJy, y(0)=0.

Solutions Defined by Integrals

The Fundamental Theorem of Calculus tells us that: If g and $\frac{dy}{dx}$ are continuous on an interval $[x_0, b)$ and x is in this interval, then

$$rac{d}{dx}\int_{x_0}^x g(t)\,dt=g(x) \quad ext{and} \quad \int_{x_0}^x rac{dy}{dt}\,dt=y(x)-y(x_0).$$

Theorem: If g is continuous on some interval containing x_0 , then the function

$$y=y_0+\int_{x_0}^x g(t)\,dt$$

is a solution of the initial value problem

$$\frac{dy}{dx} = g(x), \quad y(x_0) = y_0$$

Example

Express the solution of the IVP in terms of an integral.

$$\frac{dy}{dx} = \sin(x^2), \quad y(\sqrt{\pi}) = 1 \qquad \qquad y = y + \int_{x_0}^{x} g(t) dt$$

Wir identify the pieces
$$G(x) = Sin(x^2)$$
, $X_0 = \overline{J\pi}$, $Y_0 = 1$

The
solution
$$y = 1 + \int_{\overline{w}}^{x} \sin(t^{x}) dt$$

Into the solver solver that it solver to the solver

$$\frac{dy}{dx} = \sin(x^{L}) , \quad y(J\pi) = 1 .$$

Show $y(J\pi) = 1 : \quad y(J\pi) = 1 + \int \sin(t^{2}) dt .$
 $= 1 + 0 = 1$

Show
$$\frac{dy}{dx} = Sin(x^2)$$

 $\frac{d}{dx}y = \frac{d}{dx}\left(1 + \int_{TT}^{x} Sin(t^2)dt\right)$
 $= \frac{d}{dx}(1) + \frac{d}{dx}\int_{TT}^{x} Sin(t^2)dt$ We
 $= 0 + Sin(x^2)$ $y = C^{av}$

Section 4: First Order Equations: Linear

A first order linear equation has the form

$$a_1(x)\frac{dy}{dx}+a_0(x)y=g(x).$$

If g(x) = 0 the equation is called **homogeneous**. Otherwise it is called **nonhomogeneous**.

Provided $a_1(x) \neq 0$ on the interval *I* of definition of a solution, we can write the **standard form** of the equation $P = \frac{a_0}{a_1}$

$$\frac{dy}{dx}+P(x)y=f(x). \qquad f \quad \frac{9}{a},$$

We'll be interested in equations (and intervals I) for which P and f are continuous on I.

Solutions (the General Solution)

$$\frac{dy}{dx} + P(x)y = f(x).$$

It turns out the solution will always have a basic form of $y = y_c + y_p$ where

y_c is called the **complementary** solution and would solve the equation

$$\frac{dy}{dx} + P(x)y = 0$$

(called the associated homogeneous equation), and

▶ y_p is called the **particular** solution, and is heavily influenced by the function f(x).

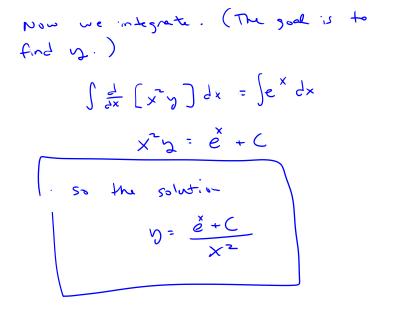

The cool thing is that our solution method will get both parts in one process—we won't get this benefit with higher order equations!

Motivating Example

$$x^2 \frac{dy}{dx} + 2xy = e^x$$
 This is not in standard form,
but well live with that for
this example.

The left hand side (that sum) is the
derivative of the product
$$x^2b$$
.
Note $\frac{d}{dx} [x^2b] = x^2 \frac{db}{dx} + 2xy$
So the OD E is
 $\frac{d}{dx} [x^2y] = e^{x}$

Derivation of Solution via Integrating Factor

Solve the equation in standard form

$$\frac{dy}{dx} + P(x)y = f(x)$$

Well multiply by a function, $\mu(x)$, so
the left hand side becomes the derivative
of a product, μy . I'll assume that
on the domain of definition, $\mu(x) > 0$.

$$\mu \frac{dy}{dx} + \mu P(x) y = \mu f(x)$$

We want the left side to be

August 25, 2021 12/35

$$\frac{d}{dx} \left[\mu y \right] = \mu \frac{dy}{dx} + \frac{d}{dx} y \xrightarrow{(m)}$$
Compare (B) and (F).

$$\mu \frac{dy}{dx} + \frac{d}{dx} y = \mu \frac{dy}{dx} + \mu P(x) y$$
This requires

$$\frac{d\mu}{dx} y = \mu P(x) y$$
We get a separable equation for μ

$$\frac{d\mu}{dx} = \mu P(x)$$

<ロ > < 合 > < 言 > < 言 > こ > う へ () August 25, 2021 13/35

General Solution of First Order Linear ODE

- Put the equation in standard form y' + P(x)y = f(x), and correctly identify the function P(x).
- Obtain the integrating factor $\mu(x) = \exp(\int P(x) dx)$.
- Multiply both sides of the equation (in standard form) by the integrating factor µ. The left hand side will always collapse into the derivative of a product

$$\frac{d}{dx}[\mu(x)y] = \mu(x)f(x).$$

Integrate both sides, and solve for y.

$$y(x) = \frac{1}{\mu(x)} \int \mu(x) f(x) \, dx = e^{-\int P(x) \, dx} \left(\int e^{\int P(x) \, dx} f(x) \, dx + C \right)$$
