INSTRUCTIONS: There are 6 problems worth 16 points each. You may use one sheet (8.5" × 11") of your own prepared notes/formulas.

No use of a calculator, text book, smart device, or other resource is permitted. Illicit use of any additional resource will result in a grade of zero on this exam as well as a formal allegation of academic misconduct. Show all of your work on the paper provided to receive full credit.

1. Classify each first order differential equation. That is, identify each equation as being Linear, Separable, or Bernoulli. (If an equation is of more than one type, you will receive full credit for correctly stating either type.)

(a) $3r = \frac{dr}{d\theta} - \theta^3$

$r' - 3r = \theta^3$

Linear

(b) $\frac{dy}{dx} = e^{ax+by}$, where a and b are positive real numbers.

$= e^{ax} \cdot e^{by}$

Separable

(c) $\frac{dx}{dt} - 2x + \cos(t) = 0$

$x' - 2x = -\cos t$

Linear

(d) $x \frac{dy}{dx} + 2y = x\sqrt{y}$

$= xy^{1/2}$

Bernoulli

2. Solve the initial value problem. Your solution can be implicit or explicit, your choice.

$$\frac{dy}{dt} = e^{-y} \cos t, \quad y(0) = 0$$

The o.d.e is separable.

$$e^y \frac{dy}{dt} = \cos t$$

$$\int e^y dy = \int \cos t dt \Rightarrow e^y = \sin t + C$$

Apply the I.C. $e^0 = \sin(0) + C$
 $1 = C$

The solution is defined implicitly
by $e^y = \sin t + 1$

Explicitly it's $y = \ln(\sin t + 1)$

3. Find all possible values of the constant m such that the function $y = x^m$ solves the differential equation

$$x^2 y'' - 3xy' + 2y = 0.$$

$$y = x^m, \quad y' = mx^{m-1}, \quad y'' = m(m-1)x^{m-2}$$

Substituting $x^2 [m(m-1)x^{m-2}] - 3x [mx^{m-1}] + 2x^m = 0$

$$x^m (m^2 - m - 3m + 2) = 0$$

This holds if $m^2 - 4m + 2 = 0$. Completing

the square

$$m^2 - 4m + 4 = 2$$

$$(m-2)^2 = 2$$

$$m-2 = \pm\sqrt{2}$$

There are two m -values

$$m = 2 \pm \sqrt{2}.$$

4. Consider the Bernoulli equation $x \frac{dy}{dx} + y = \frac{x^2}{y}$. Answer the following questions. (Note that you are not being asked to solve this ODE.)

(a) What¹ is the value of n ?

$$\frac{x^2}{y} = x^2 y^{-1}$$

$$n = -1$$

(b) What is the new variable u in terms of y ?

$$1 - n = 1 + 1 = 2$$

$$u = y^2$$

(c) What is y in terms of u ?

$$y = \sqrt{u}$$

$$\text{i.e. } u^{1/2}$$

(d) What is the linear equation (in standard form) satisfied by the new variable u ?

$$y' + \frac{1}{x}y = \frac{x}{y}$$

$$P(x) = \frac{1}{x} \quad \text{and } 1 - n = 2$$

$$f(x) = x$$

$$\frac{du}{dx} + \frac{2}{x}u = 2x$$

5. Provide a short answer for each question. Your answers should be clear and contain correct terminology or symbols.

(a) Jack solves the linear equation $xy' - y = \frac{x^2}{x^2 + 1}$ and finds $y = x \tan^{-1} x + Cx$. Identify the **complementary solution** and state how you know that you've identified the correct part.

$$y_c = Cx$$

This has the arbitrary constant in it.

$$\text{It solves } y' - \frac{1}{x}y = 0.$$

(b) Consider the problem $y'' + 4y = 0$ subject to $y(0) = 1$, $y\left(\frac{\pi}{4}\right) = -1$. Is this an **initial value problem**? (Why/why not?)

No, it's not an IVP.

The conditions are given at two different inputs, 0 and $\frac{\pi}{4}$.

¹I'm using the notational convention from this class when referring to n .

6. Solve the initial value problem using any applicable technique. Provide an explicit solution.

$$x \frac{dy}{dx} + 2y = \frac{1}{x^2}, \quad y(1) = 2 \quad \text{This is 1st order linear.}$$

In standard form it's $\frac{dy}{dx} + \frac{2}{x}y = \frac{1}{x^3}$

$$P(x) = \frac{2}{x}, \text{ so } \mu = e^{\int \frac{2}{x} dx} = e^{2 \ln x} = x^2$$

$$\frac{d}{dx}(x^2 y) = x^2 \left(\frac{1}{x^3} \right) = \frac{1}{x}$$

$$x^2 y = \int \frac{1}{x} dx = \ln|x| + C$$

The general solution

$$y = \frac{\ln|x| + C}{x^2}$$

Applying the IC

$$y(1) = \frac{\ln 1 + C}{1^2} = 2$$

$$C = 2$$

The solution to the IVP

$$y = \frac{\ln|x| + 2}{x^2}$$
