#### Section 8: Homogeneous Equations with Constant Coefficients

We were considering linear, constant coefficient, homogeneous equations.

$$a_n y^{(n)} + a_{n-1} y^{(n-1)} + \cdots + a_0 y = 0$$

where each  $a_i$  is constant.

We assume that  $y = e^{mx}$  for constant *m*, and obtain such solutions when *m* is a solution to the polynomial **characteristic equation** 

$$a_n m^n + a_{n-1} m^{n-1} + \cdots + a_1 m + a_0 = 0$$

February 24, 2023

1/47

# $a_n y^{(n)} + a_{n-1} y^{(n-1)} + \cdots + a_0 y = 0$

- ▶ We have to get *n* linearly independent solutions.
- Complex roots have to appear in conjugate pairs.
- If m<sub>i</sub> is a root of multiplicity k, we get k solutions

$$e^{m_i x}$$
,  $x e^{m_i x}$ ,  $x^2 e^{m_i x}$ , ...,  $x^{k-1} e^{m_i x}$ 

If α ± iβ is a complex conjugate pair of multiplicity k, we get 2k solutions

$$e^{\alpha x}\cos(\beta x), e^{\alpha x}\sin(\beta x), xe^{\alpha x}\cos(\beta x), xe^{\alpha x}\sin(\beta x), \dots,$$

$$x^{k-1}e^{\alpha x}\cos(\beta x), x^{k-1}e^{\alpha x}\sin(\beta x)$$

The general solution is the linear combination

$$y = c_1 y_1 + c_2 y_2 + \cdots + c_n y_n$$

### Example

Find the general solution of the ODE.

y<sup>(4)</sup>+3y"-4y = 0 4th order => our findamental solution set will have 4 lin. independent solutions

Characteristic eqn  $m^{4} + 3m^{2} - 4 = 0$ Factor  $(m^{2} + 4)(m^{2} - 1) = 0$  $(m^{2} + 4)(m - 1)(m + 1) = 0$ 

February 24, 2023

3/47

$$m^2 + 4 = 0 \implies m^2 = -4$$
  
 $m = \pm \sqrt{-4}$   
 $m = \pm 2i$   $c_{am}^{am} e^{ax}$   
 $a \pm i\beta$  where  $a = 0$   $\beta = 2$ 

$$y_{z} = e^{0x} C_{ss}(z_{X}) = C_{os}(z_{X})$$
$$y_{z} = e^{0x} S_{sn}(z_{X}) = S_{sn}(z_{X})$$

$$m-1=0 \implies m=1$$
  
 $y_3 = e^{1x}$ 

 $m+1=0 \implies m=-1$  $y_{4}=e^{-1x}$ 

February 24, 2023 4/47

<ロ> <四> <四> <三</td>

The general solution is y= C1 Gs (2x) + C2 Sin (2x) + C3 ex + C4 ex

### Example

#### Consider the ODE

$$y^{(6)} - 6y^{(4)} + 104y^{\prime\prime\prime} + 9y^{\prime\prime} - 312y^{\prime} + 2704y = 0.$$

The characteristic equation is

$$m^6 - 6m^4 + 104m^3 + 9m^2 - 312m + 2704 = 0$$

which factors as

$$((m-2)^2+9)^2(m+4)^2=0.$$

Find the general solution.

### Section 9: Method of Undetermined Coefficients

The context here is linear, constant coefficient, nonhomogeneous equations

$$a_n y^{(n)} + a_{n-1} y^{(n-1)} + \cdots + a_0 y = g(x)$$

where *g* comes from the restricted classes of functions

. ax

- polynomials,
- exponentials. e

- k- Constant ▶ sines and/or cosines,  $\leq_{in}(k_{x})$ ,  $C_{of}(k_{x})$
- and products and sums of the above kinds of functions

Recall  $y = y_c + y_p$ , so we'll have to find both the complementary and the particular solutions!

# Motivating Example<sup>1</sup>

Find a particular solution of the ODE

<sup>1</sup>We're only ignoring the  $y_c$  part to illustrate the process.  $\mathcal{P} \rightarrow \mathcal{P} \rightarrow \mathcal{P} \rightarrow \mathcal{P}$ 

$$y'' - 4y' + 4y = 8x + 1$$

$$y_{P} = Ax + B \quad \text{sub into the ODE}$$

$$y_{P}' = A$$

$$y_{P}'' = 0$$

$$y_{P}'' - 4y_{P}' + 4y_{P} = 8x + 1$$

$$0 - 4(A) + 4(Ax + B) = 8x + 1$$

$$4A x + (-4A + 4B) = 8x + 1$$

$$4A x + (-4A + 4B) = 8x + 1$$
Match like terms
$$4A = 8$$

$$-4A + 4B = 1$$

February 24, 2023 11/47

æ

A= Z, 
$$YB = 1 + YA$$
  
 $= 1 + Y(U) = 9$   
 $B = \frac{9}{4}$   
Hence  $YP = ZX + \frac{9}{4}$

## Motivating Example

Find a particular solution of the ODE

$$y'' - 4y' + 4y = 8x + 1$$

We found the particular solution

$$y_p = 2x + \frac{9}{4}$$

by

- guessing that  $y_p$  is the same kind of function as g,
- setting it up with undetermined coefficients (A, B, etc.), and
- substituting it into the ODE to find the coefficients that work.

The Method: Assume  $y_p$  has the same **form** as g(x)

$$y'' - 4y' + 4y = 6e^{-3x}$$

$$g(x) = 6e^{3x}$$

$$G(x) = 6e^{3x}$$

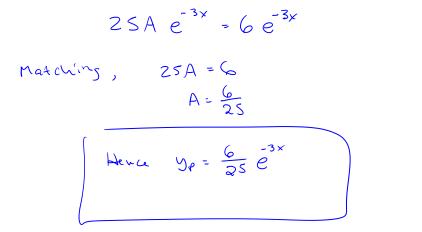

$$G(x) = 6e^{3x}$$

$$G(x) = 6e^{3x}$$

$$g_{p} = 6e^{3x}$$

$$g_{p} = -3Ae^{3x}$$
