# January 21 Math 3260 sec. 52 Spring 2022

We defined the **row echelon form** and **reduced row echelon forms** of matrices.

**Definition:** A matrix is in **row echelon form** (ref) if the following properties hold

- i Any row of all zeros are at the bottom.
- ii The first nonzero number (called the *leading entry*) in a row is to the right of the first nonzero number in all rows above it.
- iii All entries below a leading entry are zeros.

And a matrix is in **reduced row echelon form** (rref) if it is in echelon form and the following additional properties hold

- iv The leading entry of each row is 1 (called a *leading* 1), and
- v each leading 1 is the only nonzero entry in its column.

## Example (finding ref's and rref's)

$$\left[\begin{array}{rrrr} 2 & 1 & 3 \\ 4 & 3 & 6 \\ 0 & 3 & 2 \end{array}\right]$$

Using elementary row operations, an ref for this matrix is

$$\begin{bmatrix} 2 & 1 & 3 \\ 0 & 1 & 0 \\ 0 & 0 & 2 \end{bmatrix}, \begin{bmatrix} \frac{1}{2}R_3 + R_3 \\ 0 & 1 & 0 \\ 0 & 0 & 2 \end{bmatrix}, \begin{bmatrix} z & 1 & 3 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

The rref for this matrix is

$$\left[\begin{array}{rrrr}1 & 0 & 0\\0 & 1 & 0\\0 & 0 & 1\end{array}\right].$$

э

 $\sim$ 

**Theorem:** Each matrix is row equivalent to exactly one reduced row echelon matrix.

This says that the rref of a matrix is unique, and it allows the following unambiguous definition:

**Definition:** A **pivot position** in a matrix *A* is a location that corresponds to a leading 1 in the reduced echelon form of *A*. A **pivot column** of a matrix *A* is a column of *A* that contains a pivot position.

Identify the pivot position and columns given...

< □ > < @ > < E > < E > E のへで January 19, 2022 4/17

# Complete Row Reduction isn't needed to find Pivots

Find the pivot positions and pivot columns of the matrix

This matrix has an ref and rref

$$\begin{bmatrix} 1 & 1 & 4 \\ 0 & 3 & 6 \\ 0 & 0 & 0 \end{bmatrix} \text{ and } \begin{bmatrix} 1 & 0 & 2 \\ 0 & 1 & 2 \\ 0 & 0 & 0 \end{bmatrix}, \text{ respectively.}$$

To obtain an echelon form, we work from left to right beginning with the top row working downward.

Step 1: Unless the left most column is all zeros, the left most column is a pivot column. The top position is a pivot position. Step 2: Get a nonzero entry in the top left position by row swapping if needed.

$$\begin{bmatrix} 3 & -9 & 12 & 6 & -9 \\ 3 & -7 & 8 & 8 & -5 \\ 0 & 3 & -6 & 4 & 6 \end{bmatrix}$$

$$\begin{bmatrix} 3 & -9 & 12 & 6 & -9 \\ 3 & -7 & 8 & 8 & -5 \\ 0 & 3 & -6 & 4 & 6 \end{bmatrix}$$

Step 3: Use row operations to get zeros in all entries below the pivot.

$$-R_{1}+R_{2} \rightarrow R_{2}$$

$$\begin{bmatrix} 3 & -9 & 12 & 6 & -9 \\ 0 & 2 & -4 & 2 & 4 \\ 0 & 3 & -6 & 4 & 6 \end{bmatrix}$$

January 19, 2022 7/17

・ロト ・日下 ・ ヨト ・

Step 4: Ignore the row with a pivot, all rows above it, the pivot column, and all columns to its left, and repeat steps 1-3 for each pivot position.

0 -3 6 -3 -6 0 -3 -6 - 4 Cn

To obtain a reduced row echelon form: Starting with the right most pivot and working up and to the left, use row operations to get a zero in each position above a pivot. Scale to make each pivot a 1.

$$\begin{bmatrix} 3 & -9 & 12 & 6 & -9 \\ 0 & 1 & -2 & 1 & 2 \\ 0 & 0 & 0 & 1 & 0 \end{bmatrix}$$
 Clear out the 6 and 1  
in column 4 above the last  
pivot  
$$-R_3 + R_2 \Rightarrow R_2 \quad \text{and} \quad -6R_3 + R_1 \Rightarrow \delta R_1$$
$$\begin{pmatrix} 3 & -9 & 12 & 0 & -9 \\ 0 & 1 & -2 & 0 & 2 \\ 0 & 0 & 0 & 1 & 0 \end{pmatrix}$$

January 19, 2022

Clear out the -9 about the pivel  
position row 2 column 2.  

$$9R_2 + R_1 \Rightarrow R_1$$

# Echelon Form & Solving a System

# **Remark:** The row operations used to get an rref correspond to an equivalent system!

Consider the reduced echelon matrix, and describe the solution set for the associated system of equations (the one who'd have this as its augmented matrix).

X<sub>1</sub> + X<sub>2</sub> = 3 X<sub>3</sub> - ZX<sub>5</sub> = 4 X<sub>4</sub> = -9 0=0 The solutions are given by X<sub>1</sub> = 3 - X<sub>2</sub> X<sub>2</sub> + X<sub>5</sub> can be any X<sub>3</sub> = 4 + 2X<sub>5</sub> real numbers  $X_{4} = -9$ January 19, 2022 13/17

## **Basic & Free Variables**

Suppose a system has *m* equations and *n* variables,  $x_1, x_2, ..., x_n$ . The first *n* columns of the augmented matrix correspond to the *n* variables.

- If the *i<sup>th</sup>* column is a pivot column, then x<sub>i</sub> is called a **basic** variable.
- If the *i<sup>th</sup>* column is NOT a pivot column, then x<sub>i</sub> is called a free variable.

$$\begin{bmatrix} 1 & 1 & 0 & 0 & 0 & 3 \\ 0 & 0 & 1 & 0 & -2 & 4 \\ 0 & 0 & 0 & 1 & 0 & -9 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

The system would have 4 equations in 5 variables. The basic variables are  $x_1$   $x_3$  and  $x_4$ . The free variables are  $x_2$  and  $x_5$ .
