Section 4.2: Null & Column Spaces, Row Space, Linear Transformations

In this section, we'll consider some subspaces (of \mathbb{R}^n or \mathbb{R}^m) associated with a matrix, and extend the notion of a linear transformation to functions between arbitrary vector spaces.

Definition

Definition: Let *A* be an $m \times n$ matrix. The **null space** of *A*, denoted by Nul *A*, is the set of all solutions of the homogeneous equation $A\mathbf{x} = \mathbf{0}$. That is

$$\mathsf{Nul}\, A = \{\mathbf{x} \in \mathbb{R}^n \mid A\mathbf{x} = \mathbf{0}\}.$$

A D N A B N A B N A B N

Express Nul(*A*) in terms of a spanning set, where $A = \begin{bmatrix} 1 & 0 & 3 \\ 1 & 2 & 7 \end{bmatrix}$. (Note: a spanning set for Nul(*A*) is called an *explicit description* of it.)

Nul(A) is the s_t of all vectors
$$\vec{X}$$

in \vec{R}^3 such that $\vec{A} \cdot \vec{X} = \vec{O}$. Lie can
use an augmented matrix $[\vec{A} \cdot \vec{O}]$.
 $\begin{bmatrix} 1 & 0 & 3 & 0 \\ 1 & z & 7 & 0 \end{bmatrix} \xrightarrow{rref} \begin{bmatrix} 1 & 0 & 3 & 0 \\ 0 & 1 & z & 0 \end{bmatrix}$.
If $\vec{X} = \begin{bmatrix} X_1 \\ X_2 \\ X_3 \end{bmatrix}$, then $\begin{array}{c} X_1 = -3X_3 \\ X_2 = -ZX_3 \\ X_3 \text{ is free} \end{array}$

 $\vec{\chi} = \begin{pmatrix} -3\chi_3 \\ -2\chi_2 \\ \chi_3 \end{pmatrix} = \chi_3 \begin{pmatrix} -3 \\ -2 \\ -2 \\ 1 \end{pmatrix},$ $Nul(A) = Spon \left\{ \begin{bmatrix} -3 \\ -2 \\ 1 \end{bmatrix} \right\}.$ 5.

The Null Space as a Subspace

Theorem:

If *A* is an $m \times n$ matrix, then Nul(*A*) is a subspace of \mathbb{R}^n .

March 20, 2024 4/21

Column Space

Definition:

The **column space** of an $m \times n$ matrix A, denoted Col A, is the set of all linear combinations of the columns of A. If $A = [\mathbf{a}_1 \cdots \mathbf{a}_n]$, then

$$\operatorname{Col} A = \operatorname{Span} \{ \mathbf{a}_1, \ldots, \mathbf{a}_n \}.$$

Theorem:

The column space of an $m \times n$ matrix A is a subspace of \mathbb{R}^m .

Corollary

Col $A = \mathbb{R}^m$ if and only if the equation $A\mathbf{x} = \mathbf{b}$ has a solution for every **b** in \mathbb{R}^m .

Find a matrix A such that W = Col A where

$$W = \left\{ \left[\begin{array}{c} 6a - b \\ a + b \\ -7a \end{array} \right] \mid a, b \in \mathbb{R} \right\}.$$

Use can characterize an element of W
as a linear combine of fixed vectors and then
as a product
$$A\vec{X}$$
. Consider any vector
from W.
 $\begin{bmatrix} 6a-b\\a+b\\-7a\end{bmatrix} = \begin{bmatrix} 6a\\a\\-7a\end{bmatrix} + \begin{bmatrix} -b\\b\\-b\\-7a\end{bmatrix}$

$$= a \begin{bmatrix} 6\\1\\-7 \end{bmatrix} + b \begin{bmatrix} -1\\1\\0 \end{bmatrix}$$
$$= \begin{bmatrix} 6\\-7\\-7\\0 \end{bmatrix} \begin{bmatrix} 6\\-1\\-7\\0 \end{bmatrix} \begin{bmatrix} 6\\-1\\-7\\0 \end{bmatrix} -$$

Letting $A = \begin{bmatrix} 6\\-1\\-7\\0 \end{bmatrix} -$
 $W = Col(A).$

Definition:

The **row space**, denoted Row *A*, of an $m \times n$ matrix *A* is the subspace of \mathbb{R}^n spanned by the rows of *A*.

Theorem

If two matrices *A* and *B* are row equivalent, then their row spaces are the same.

March 20, 2024

8/21

Find two spanning sets for Row(A) given

$$A = \begin{bmatrix} 2 & 4 & -2 & 1 \\ -2 & -5 & 7 & 3 \\ 3 & 7 & -8 & 6 \end{bmatrix} \xrightarrow{\text{rref}} \begin{bmatrix} 1 & 0 & 9 & 0 \\ 0 & 1 & -5 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\operatorname{Rom}(A) : \operatorname{Span}\left(\begin{array}{c} 2\\ 4\\ -z\\ 1 \end{array}\right), \begin{array}{c} -z\\ 7\\ 7\\ 3 \end{array}\right), \begin{array}{c} -z\\ -8\\ 6 \end{array}\right) = \operatorname{Span}\left(\begin{array}{c} 1\\ 0\\ 9\\ 0 \end{array}\right), \begin{array}{c} 0\\ -z\\ 0 \end{array}\right), \begin{array}{c} 0\\ 0\\ 0\\ 0 \end{array}\right).$$

March 20, 2024 9/21

イロト イヨト イヨト イヨト

Comparing Col(A) and Nul(A)

$$A = \left[\begin{array}{rrrr} 2 & 4 & -2 & 1 \\ -2 & -5 & 7 & 3 \\ 3 & 7 & -8 & 6 \end{array} \right]$$

(a) If Col A is a subspace of \mathbb{R}^k , what is k? $Col(A) = Spen \{ column of A \}$, k = 3

(b) If Nul A is a subspace of \mathbb{R}^k , what is k? we need $A \stackrel{\times}{\times} to be defined.$ $<math>k = \mathcal{Y}$.

March 20, 2024 10/21

イロト イポト イヨト イヨト

Example Continued...

$$A = \begin{bmatrix} 2 & 4 & -2 & 1 \\ -2 & -5 & 7 & 3 \\ 3 & 7 & -8 & 6 \end{bmatrix}, \text{ and } \mathbf{u} = \begin{bmatrix} 3 \\ -2 \\ -1 \\ 0 \end{bmatrix}$$

(c) Is **u** in Nul A? Could **u** be in Col A?

$$\begin{aligned} \vec{u} \text{ is in Null(A) if } A\vec{u} = \vec{0} \\ A\vec{u} = \begin{pmatrix} 0 \\ -3 \\ 3 \end{pmatrix} \neq \vec{0} \quad \Rightarrow \vec{u} \text{ is not in Null(A)} \\ \vec{u} \text{ is in } R^{4} \text{ whereas } Col(A) \text{ is a subspace } \\ of R^{3} . $\vec{u} \text{ con't be in } Col(A) \end{aligned}$$$

March 20, 2024 11/21

Example Continued...

$$A = \begin{bmatrix} 2 & 4 & -2 & 1 \\ -2 & -5 & 7 & 3 \\ 3 & 7 & -8 & 6 \end{bmatrix}, \text{ and } \mathbf{v} = \begin{bmatrix} 3 \\ -1 \\ 3 \end{bmatrix}$$

(d) Is **v** in Col *A*? Could **v** be in Nul *A*?

Av isn't defined, so v can't be in Nul(A) V is in Col(A) if AX = V is consistent. Le can use an ainsmanted matrix, $\left[A \stackrel{?}{\lor} \right] = \left[\begin{array}{cccc} 2 & 4 & -2 & 1 & 3 \\ -2 & -5 & 7 & 3 & -1 \\ 3 & 7 & -8 & 6 & 3 \end{array} \right] \xrightarrow{\text{rret}}$

March 20, 2024 12/21

$$A\vec{x} = \vec{v}$$
 is consistent. Hence
 \vec{v} is in $Col(A)$.

Fundamental Subspaces

People often refer to four fundamental subspaces associated with an $m \times n$ matrix. The fourth one is the null space of A^{T} .

Remark: Since the rows of A are the columns of A^{T} and vice versa. it's not surprising that

 $Col(A) = Row(A^T)$ and $Row(A) = Col(A^T)$.

Remark: We can summarize that for $m \times n$ matrix A

Col(A) and Nul(A^T) are subspaces of \mathbb{R}^m ,

and

Row(A) and Nul(A) are subspaces of \mathbb{R}^n .

March 20, 2024

14/21

Linear Transformation

Definition:

Let *V* and *W* be vector spaces. A linear transformation $T: V \rightarrow W$ is a rule that assigns to each vector **x** in *V* a unique vector $T(\mathbf{x})$ in *W* such that

(i)
$$T(\mathbf{u} + \mathbf{v}) = T(\mathbf{u}) + T(\mathbf{v})$$
 for every \mathbf{u}, \mathbf{v} in V, and

(ii) $T(c\mathbf{u}) = cT(\mathbf{u})$ for every **u** in *V* and scalar *c*.

Remark: The only difference between this definition and our previous one is that the domain and codomain spaces can be any vector spaces.

< ロ > < 同 > < 回 > < 回 >

March 20, 2024

15/21

Let $C^1(\mathbb{R})$ denote¹ the set of all real valued functions that are differentiable and $C^0(\mathbb{R})$ the set of all continuous real valued functions. Note that differentiation is a linear transformation. That is

$$D: C^1(\mathbb{R}) \longrightarrow C^0(\mathbb{R}), \quad D(f) = f'$$

satisfies the two conditions in the previous definition.

We know from calculus that if f and g are differentiable and c is a scalar, then

$$\frac{d}{dx}(f(x)+g(x))=f'(x)+g'(x) \quad \text{and} \quad \frac{d}{dx}(cf(x))=cf'(x).$$

Using the current notation, we can write these statements like

D(f+g) = D(f) + D(g) and D(cf) = cD(f).

¹This could also be written as $C^1(-\infty,\infty)$.

March 20, 2024 16/21

Consider the derivative transformation on $C^1(\mathbb{R})$

$$D: C^1(\mathbb{R}) \longrightarrow C^0(\mathbb{R})$$

 $f \mapsto f'$

Characterize the subset of $C^1(\mathbb{R})$ such that D(f) = 0.

This is the set of constant functions on TR. f(x) = C for all x when C is some constant.

Note: The zero vector in $C^{\circ}(IR)$ is the function $f_{\circ}(x) = 0$ for all real x.

March 20, 2024

17/21

Range and Kernel

Definition:

The **range** of a linear transformation $T : V \longrightarrow W$ is the set of all vectors in W of the form $T(\mathbf{x})$ for some \mathbf{x} in V. (The set of all images of elements of V.)

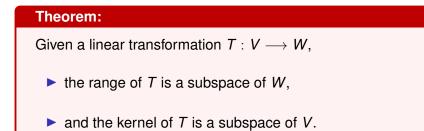

A column space is a **range**.

Definition:

The **kernel** of a linear transformation $T : V \longrightarrow W$ is the set of all vectors **x** in *V* such that $T(\mathbf{x}) = \mathbf{0}$. (The analog of the null space of a matrix.)

A null space is a kernel.

Range & Kernel as Subspaces

Remark: This generalizes the result for column and null spaces. If $T : \mathbb{R}^n \to \mathbb{R}^m$, $T(\mathbf{x}) = A\mathbf{x}$. Then Col(*A*) is the range of *T* and is a subspace of \mathbb{R}^m . And Nul(*A*) is the kernel of *T* and is a subspace of \mathbb{R}^n .

Consider $T: C^1(\mathbb{R}) \longrightarrow C^0(\mathbb{R})$ defined by

$$T(f) = \frac{df}{dx} + \alpha f(x), \quad \alpha \text{ a fixed constant.}$$

(a) Express the equation that a function y must satisfy if y is in the kernel of T.

y is in the kernel if
$$T(y) = 0$$
.
 $F(y) = \frac{dy}{dx} + dy$
y is in the kernel of T if
 $\frac{dy}{dx} + dy = 0$

March 20, 2024 20/21

イロト 不得 トイヨト イヨト 二日

$$T: C^1(\mathbb{R}) \longrightarrow C^0(\mathbb{R}), \quad T(f) = \frac{df}{dx} + \alpha f(x)$$

(b) Show that for any scalar c, $y = ce^{-\alpha x}$ is in the kernel of T.

To be in the kernel, we need dy + ory = 0. If y= ce, then dy = ce (-a) = - d(P $\frac{dy}{dx}$ + ay = - ace^{-ax} + $a(ce^{-ax}) = 0$ So y= ce is in the kerrel of T.
