

Section 15: Shift Theorems

Suppose we wish to evaluate $\mathcal{L}^{-1} \left\{ \frac{2}{(s-1)^3} \right\}$. Does it help to know that $\mathcal{L} \{ t^2 \} = \frac{2}{s^3}$?

By definition $\mathcal{L} \{ e^{st} t^2 \} = \int_0^\infty e^{-st} e^{st} t^2 dt$

$$e^{-st} \cancel{e^{st}}$$

$$= \int_0^\infty e^{-(s-1)t} t^2 dt$$

$$= e^{-st+t}$$

$$= \int_0^\infty e^{-pt} t^2 dt \quad \text{if } p=s-1$$

$$= e^{-(s-1)t}$$

$$= F(p) \quad \text{if } F(s) = \mathcal{L} \{ t^2 \}$$

$$\mathcal{L}^{-1} \left\{ \frac{2}{(s-1)^3} \right\}$$

If $f(t) = t^2$, then $F(s) = \mathcal{L}\{t^2\} = \frac{2}{s^3}$, and

$$F(s-1) = \frac{2}{(s-1)^3} = \mathcal{L}\{e^t t^2\}.$$

In general, if $F(s) = \mathcal{L}\{f(t)\}$, then

$$\begin{aligned} F(s-a) &= \int_0^\infty e^{-(s-a)t} f(t) dt = \int_0^\infty e^{-st} [e^{at} f(t)] dt \\ &= \mathcal{L}\{e^{at} f(t)\} \end{aligned}$$

Theorem (translation in s)

Suppose $\mathcal{L}\{f(t)\} = F(s)$. Then for any real number a

$$\mathcal{L}\{e^{at}f(t)\} = F(s - a).$$

In other words, if $F(s)$ has an inverse Laplace transform, then

$$\mathcal{L}^{-1}\{F(s - a)\} = e^{at}\mathcal{L}^{-1}\{F(s)\}.$$

Example

Evaluate

$$(a) \mathcal{L}\{t^6 e^{3t}\} = \frac{6!}{(s-3)^7}$$

$$\mathcal{L}\{t^6\} = \frac{6!}{s^7} = F(s)$$

$a=3$

$$(b) \mathcal{L}\{e^{-t} \cos(t)\} = \frac{s - (-1)}{(s - (-1))^2 + 1}$$
$$= \frac{s+1}{(s+1)^2 + 1}$$

$$\mathcal{L}\{\cos t\} = \frac{s}{s^2 + 1} = F(s)$$

$a=-1$

$$(c) \mathcal{L}\{e^{-t} \sin(t)\}$$
$$= \frac{1}{(s+1)^2 + 1}$$

$$\mathcal{L}\{\sin t\} = \frac{1}{s^2 + 1} = F(s)$$

$a=-1$

Inverse Laplace Transforms (completing the square)

(a) $\mathcal{L}^{-1} \left\{ \frac{s}{s^2 + 2s + 2} \right\}$

$s^2 + 2s + 2$ is irreducible

Complete the square.

$$s^2 + 2s + 1 - 1 + 2 = s^2 + 2s + 1 + 1 = (s+1)^2 + 1$$

$$\frac{s}{s^2 + 2s + 2} = \frac{s}{(s+1)^2 + 1} \quad \begin{matrix} \leftarrow & \text{we} \\ \text{need } s+1 & \text{here too} \end{matrix}$$

use that $s = s+1 - 1$

Hence

$$\frac{s}{s^2 + 2s + 2} = \frac{s+1-1}{(s+1)^2 + 1} = \frac{s+1}{(s+1)^2 + 1} - \frac{1}{(s+1)^2 + 1}$$

looks like $\frac{s}{s^2 + 1}$ $\frac{1}{s^2 + 1}$

$$\mathcal{L}^{-1}\left\{\frac{s}{s^2 + 2s + 2}\right\} = \mathcal{L}^{-1}\left\{\frac{s+1}{(s+1)^2 + 1}\right\} - \mathcal{L}^{-1}\left\{\frac{1}{(s+1)^2 + 1}\right\}$$

$$F(s) = \frac{s}{s^2 + 1} \quad F(s) = \frac{1}{s^2 + 1}$$

$$= e^{-t} \mathcal{L}^{-1}\left\{\frac{s}{s^2 + 1}\right\} - e^{-t} \mathcal{L}^{-1}\left\{\frac{1}{s^2 + 1}\right\}$$

$$= e^{-t} \cos t - e^{-t} \sin t$$

Inverse Laplace Transforms (repeat linear factors)

$$(b) \quad \mathcal{L}^{-1} \left\{ \frac{1+3s-s^2}{s(s-1)^2} \right\}$$

Do a partial fraction decompt.

$$\frac{1+3s-s^2}{s(s-1)^2} = \frac{A}{s} + \frac{B}{s-1} + \frac{C}{(s-1)^2} \quad \text{clear fraction -}$$

$$1+3s-s^2 = A(s-1)^2 + Bs(s-1) + Cs$$

$$= A(s^2 - 2s + 1) + B(s^2 - s) + Cs$$

$$\begin{aligned} -s^2 + 3s + 1 &= (A+B)s^2 + (-2A-B+C)s + A \\ &= \underline{\underline{=}} \quad \underline{\underline{=}} \end{aligned}$$

$$A + B = -1$$

$$-2A - B + C = 3$$

$$A = 1$$

$$B = -1 - A = -2$$

$$C = 3 + 2A + B = 3 + 2 - 2 = 3$$

$$\frac{1+3s-s^2}{s(s-1)^2} = \frac{1}{s} - \frac{2}{s-1} + \frac{3}{(s-1)^2}$$

$$\mathcal{L}^{-1}\left\{\frac{1+3s-s^2}{s(s-1)^2}\right\} = \mathcal{L}^{-1}\left\{\frac{1}{s}\right\} - 2 \mathcal{L}^{-1}\left\{\frac{1}{s-1}\right\} + 3 \mathcal{L}^{-1}\left\{\frac{1}{(s-1)^2}\right\}$$

Looks like
 $\frac{1}{s^2}$

$$= 1 - 2e^t + 3e^t \mathcal{L}^{-1}\left\{\frac{1}{s^2}\right\}$$

$$= 1 - 2e^t + 3e^t t$$
