September 1 Math 2306 sec. 51 Fall 2021 Section 4: First Order Equations: Linear

NOTE: Ignore Exercises 8, 9, 10, 11, 12 in section 4 of the workbook.

Suppose P(x) and f(x) are continuous on some interval (a, b) and n is a real number different from 0 or 1 (not necessarily an integer). An equation of the form

$$\frac{dy}{dx} + P(x)y = f(x)y^n$$

is called a **Bernoulli** equation.

The solution to a Bernoulli equation is obtained by setting $u = y^{1-n}$. Then *u* solves the first order linear ODE

$$\frac{du}{dx}+(1-n)P(x)u=(1-n)f(x),$$

 $V = U^{\frac{1}{1-n}}.$

and

∃ <0 < C</p>

Example (from last class)

Solve the initial value problem $y' - y = -e^{2x}y^3$, subject to y(0) = 1.

We set $u = y^{1-3} = y^{-2}$. This resulted in the equation for u

$$\frac{du}{dx} + 2u = 2e^{4x}$$

which has solutions

$$u=\frac{1}{2}e^{2x}+Ce^{-2x}.$$

Since $y = u^{-1/2}$, this gave

$$y = rac{1}{\sqrt{rac{1}{2}e^{2x} + Ce^{-2x}}}.$$

After applying the initial condition, we find C = 1/2 so that the solution to the IVP

$$y = \frac{1}{\sqrt{\frac{1}{2}e^{2x} + \frac{1}{2}e^{-2x}}} \implies y = \frac{\sqrt{2}}{\sqrt{\frac{e^{2x}}{1 + \frac{1}{2}e^{-2x}}}}.$$

We wish to solve the ODE
$$\frac{dy}{dx} + \frac{2}{x}y = 8\sqrt{y}$$
.

What is the value of n?

n= -z

Population Dynamics

A population of dwarf rabbits grows at a rate proportional to the current population. In 2011, there were 58 rabbits. In 2012, the population was up to 89 rabbits. Estimate the number of rabbits expected in the population in 2021.

Let's call the population at fine t
P(t). We can let P be population density.
The rate of change of P is

$$\frac{dP}{dt} = \frac{dP}{dt} = \frac{P}{r_{p}} \frac{P}{$$

This gives the ODE
$$\frac{dP}{dt} = kP$$
 for some
constant of proportionality k. If we
take this years with t=0 in 2011,
then $P(0) = 58$ and $P(1) = 89$.
We can solve the IVP
 $\frac{dP}{dt} = kP$, $P(0) = 58$.
The ODE is both separable and linear.
Let's separate variables
 $\frac{dP}{dt} = k$

$$\int \frac{1}{P} dP = \int k dt$$

$$\int n |P| = kt + C$$

$$e^{Jn|P|} = e^{kt+C} = e^{C}e^{kt}$$

$$|P| = e^{C}e^{kt}, \quad Ld \quad A = \pm e^{C}$$

$$P = A e^{kt}$$

$$Jsing the IC \quad P(0 = 59, \\ S8 = A e^{0} = A \implies A = 58$$

C

ペロト < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

So the population

$$P(t) = 58 e^{kt}$$

We can find k using $P(1) = 89$
 $89 = 58 e^{k} \Rightarrow k = 4h \frac{89}{58}$
Hence $P(t) = 58 e^{t \ln(\frac{89}{58})}$
This model predicts
 $P(1\delta) = 58 e^{10 \ln(\frac{89}{58})} \simeq 4198$.
Cabbits, in 2021.

Exponential Growth or Decay

If a quantity *P* changes continuously at a rate proportional to its current level, then it will be governed by a differential equation of the form

$$\frac{dP}{dt} = kP$$
 i.e. $\frac{dP}{dt} - kP = 0.$

Note that this equation is both separable and first order linear. If k > 0, *P* experiences **exponential growth**. If k < 0, then *P* experiences **exponential decay**.
