Section 7: Reduction of Order

- We start with a second order, linear, homogeneous ODE in standard form
$$\frac{d^2y}{dx^2}+P(x)\frac{dy}{dx}+Q(x)y=0.$$
- We know one solution y_1. (Keep in mind that y_1 is a known!)
- We know there is a second linearly independent solution (section 6 theory says so).
- We try to find y_2 by guessing that it can be found in the form
$$y_2(x)=u(x)y_1(x)$$
where the goal becomes finding u.
- **Due to linear independence, we know that u cannot be constant.**

Generalization

Consider the equation **in standard form** with one known solution. Determine a second linearly independent solution.

$$\frac{d^2y}{dx^2} + P(x)\frac{dy}{dx} + Q(x)y = 0, \quad y_1(x) - \text{is known.}$$

Suppose $y_2 = uy_1$ ← this guess is an ansatz

$y_2' = u'y_1 + uy_1'$

$y_2'' = u''y_1 + u'y_1' + u'y_1' + uy_1''$

$y_2'' = u''y_1 + 2u'y_1' + uy_1''$

We know that $y_1'' + P(x)y_1' + Q(x)y_1 = 0.$

$$y_2'' + P(x) y_2' + Q(x) y_2 = 0$$

$$u'' y_1 + 2u'y_1' + uy_1'' + P(x)(u'y_1 + uy_1') + Q(x) u y_1 = 0$$

Collect u'', u', and u

$$y_1 u'' + (2y_1' + P(x) y_1) u' + \underbrace{(y_1'' + P(x) y_1' + Q(x) y_1)}_{\text{"}0\text{"}} u = 0$$

since y_1 solves the ODE

u solves

$$y_1 u'' + (2y_1' + P(x) y_1) u' = 0$$

Let $w = u'$, then $w' = u''$ and w solve

$$y_1 w' + (2y_1' + P(x) y_1) w = 0$$

Assume $y_1(x) \neq 0$ on the domain, and assume $w > 0$.

$$w' + \left(2\frac{y_1'}{y_1} + P(x)\right) w = 0$$

1st order linear and separable. Let's separate variables

$$\frac{dw}{dx} = -\left(2\frac{\frac{dy_1}{dx}}{y_1} + P(x)\right) w$$

$$\frac{1}{w}\frac{dw}{dx} = -\left(2\,\frac{\frac{dy_1}{dx}}{y_1} + P(x)\right)$$

$$\frac{1}{w}\frac{dw}{dx}\,dx = -\left(2\,\frac{dy_1/dx}{y_1} + P(x)\right)dx$$

$$\frac{1}{w}\,dw = -2\,\frac{\frac{dy_1}{dx}}{y_1}\,dx - P(x)\,dx$$

$$\frac{1}{w}\,dw = -2\,\frac{dy_1}{y_1} - P(x)\,dx$$

$$\int \frac{1}{w}\,dw = -2\int \frac{dy_1}{y_1} - \int P(x)\,dx$$

$$\ln w = -2\ln|y_1| - \int P(x)\,dx$$

$$\ln w = \ln y_1^{-2} - \int P(x)\,dx$$

Exponentiate

$$w = e^{\ln y_1^{-2} - \int P(x)\,dx}$$

$$= e^{\ln y_1^{-2}} \cdot e^{-\int P(x)\,dx}$$

$$\Rightarrow \quad w = \frac{e^{-\int P(x)\,dx}}{y_1^2}$$

$$w = u' \quad \Rightarrow \quad u = \int w\,dx$$

Hence
$$u = \int \frac{e^{-\int P(x)dx}}{y_1^2}\,dx$$

$y_2 = u y_1$ and the general solution

$$y = c_1 y_1 + c_2 y_2$$

Reduction of Order Formula

For the second order, homogeneous equation **in standard form** with one known solution y_1, a second linearly independent solution y_2 is given by

$$y_2 = y_1(x) \int \frac{e^{-\int P(x)\,dx}}{(y_1(x))^2}\,dx$$

Example

Find the solution of the IVP where one solution of the ODE is given.

$$y'' + 4y' + 4y = 0 \quad y_1 = e^{-2x}, \quad y(0) = 1, \quad y'(0) = 1$$

Find the general solution $y = C_1 y_1 + C_2 y_2$

we can use reduction of order to find y_2.

$$y_2 = u y_1 \text{ where } u = \int \frac{e^{-\int P(x)dx}}{y_1^2}\,dx$$

The ODE is in standard form $P(x) = 4$

$$-\int p(x)\,dx = -\int 4\,dx = -4x \quad (\text{ignoring } +C)$$

$$e^{-\int p(x)\,dx} = e^{-4x}. \quad \text{Given } y_1 = e^{-2x}$$

$$u = \int \frac{e^{-\int p(x)\,dx}}{y_1^2}\,dx = \int \frac{e^{-4x}}{\left(e^{-2x}\right)^2}\,dx$$

$$= \int \frac{e^{-4x}}{e^{-4x}}\,dx = \int dx = x$$

$$y_2 = u y_1 = x e^{-2x}$$

The general solution to the ODE is

$$y = c_1 e^{-2x} + c_2 x e^{-2x}$$

Apply $y(0) = 1$, $y'(0) = 1$

$$y' = -2c_1 e^{-2x} + c_2 e^{-2x} - 2c_2 x e^{-2x}$$

$$y(0) = c_1 e^0 + c_2 \cdot 0 \cdot e^0 = 1 \Rightarrow c_1 = 1$$

$$y'(0) = -2c_1 e^0 + c_2 e^0 - 2c_2 \cdot 0 \cdot e^0 = 1$$

$$-2c_1 + c_2 = 1 \Rightarrow c_2 = 1 + 2c_1 = 1 + 2 = 3$$

$$\boxed{\text{The solution to the IVP is } y = e^{-2x} + 3x e^{-2x}}$$
