#### Section 8: Homogeneous Equations with Constant Coefficients

We are considering the second order, linear, homogeneous ODE with constant coefficients

$$ay'' + by' + cy = 0.$$

The function  $y = e^{mx}$  is a solution provided *m* is a solution of the **characteristic equation** 

$$am^2+bm+c=0.$$

We have to consider three cases,

- **Case I:** there are two different real roots,  $m_1 \neq m_2$ ,
- **Case II:** there is one repeated real root,  $m_1 = m_2 = m$ ,
- **Case III:** the roots are complex conjugates  $m = \alpha \pm i\beta$  with  $\beta > 0$ .

#### Case I: Two distinct real roots

$$ay'' + by' + cy = 0$$
, where  $b^2 - 4ac > 0$ .

There are two different roots  $m_1$  and  $m_2$ . A fundamental solution set consists of

$$y_1 = e^{m_1 x}$$
 and  $y_2 = e^{m_2 x}$ .

The general solution is

$$y = c_1 e^{m_1 x} + c_2 e^{m_2 x}.$$

September 27, 2023 2/19

イロト イポト イヨト イヨト

#### Case II: One repeated real root

$$ay'' + by' + cy = 0$$
, where  $b^2 - 4ac = 0$ 

If the characteristic equation has one real repeated root m, then a fundamental solution set to the second order equation consists of

$$y_1 = e^{mx}$$
 and  $y_2 = xe^{mx}$ .

The general solution is

$$y=c_1e^{mx}+c_2xe^{mx}.$$

September 27, 2023 3/19

< ロ > < 同 > < 回 > < 回 >

### Case III: Complex conjugate roots

$$ay'' + by' + cy = 0$$
, where  $b^2 - 4ac < 0$ 

The two roots of the characteristic equation will be

$$m_1 = \alpha + i\beta$$
 and  $m_2 = \alpha - i\beta$  where  $i^2 = -1$ .

We want our solutions in the form of <u>real valued</u> functions. We start by writing a pair of solutions

$$Y_1 = e^{(\alpha + i\beta)x} = e^{\alpha x} e^{i\beta x}$$
, and  $Y_2 = e^{(\alpha - i\beta)x} = e^{\alpha x} e^{-i\beta x}$ .

September 27, 2023

4/19

We will use the **principle of superposition** to write solutions  $y_1$  and  $y_2$  that do not contain the complex number *i*.

### Deriving the solutions Case III

Recall Euler's Formula<sup>1</sup> :  $e^{i\theta} = \cos \theta + i \sin \theta$ .

$$Y_{1} = e^{\alpha x} e^{i\beta x} = e^{\alpha x} \left( C_{0s}(\beta x) + i S_{1n}(\beta x) \right)$$
  

$$= e^{\alpha x} C_{0s}(\beta x) + i e^{\beta x} S_{1n}(\beta x)$$
  

$$Y_{2} = e^{\alpha x} e^{-i\beta x} = e^{\alpha x} \left( C_{0s}(\beta x) - i S_{1n}(\beta x) \right)$$
  

$$= e^{\alpha x} C_{0s}(\beta x) - i e^{\beta x} S_{1n}(\beta x)$$
  

$$S_{1} = \frac{1}{2}(Y_{1} + Y_{2}) = \frac{1}{2}(2i e^{\alpha x} S_{1n}(\beta x)) = e^{\beta x} S_{1n}(\beta x)$$
  

$$Y_{2} = \frac{1}{2i}(Y_{1} - Y_{2}) = \frac{1}{2i}(2i e^{\alpha x} S_{1n}(\beta x)) = e^{\alpha x} S_{1n}(\beta x)$$

<sup>1</sup>As the sine is an odd function  $e^{-i\theta} = \cos \theta - i \sin \theta$ .

In the complex case, we must identify

the of and B parts.

#### Case III: Complex conjugate roots

$$ay'' + by' + cy = 0$$
, where  $b^2 - 4ac < 0$ 

Let  $\alpha$  be the real part of the complex roots and  $\beta > 0$  be the imaginary part of the complex roots. Then a fundamental solution set is

$$y_1 = e^{\alpha x} \cos(\beta x)$$
 and  $y_2 = e^{\alpha x} \sin(\beta x)$ .

The general solution is

$$y = c_1 e^{\alpha x} \cos(\beta x) + c_2 e^{\alpha x} \sin(\beta x).$$

# Example

Find the general solution of 
$$\frac{d^2x}{dt^2} + 4\frac{dx}{dt} + 6x = 0.$$
  
The ode is linear, honogeneous w) constant  
coefficients. The characteristic equation is  
 $m^2 + 4m + 6 = 0$   
Quadratic formula:  $m = \frac{-4 \pm \sqrt{4^2 - 4(1)(6)}}{2(1)} = \frac{-4 \pm \sqrt{-9}}{2}$   
 $= -\frac{4 \pm 2\sqrt{2}i}{2} = -2 \pm \sqrt{2}i$   
Confident space :  $m^2 + 4m + 4 - 4 + 6 = 0$   
 $(m+2)^2 + 2 = 0$ 

September 27, 2023 8/19

$$m_{+2}^{2} = -2$$

$$m_{+2} = \pm J_{-2} = \pm J_{-2}^{2} i$$

$$m_{-2} = \pm J_{-2}^{2} i$$

$$X_1 = e^{-2t} \cos(52t), \quad X_2 = e^{-2t} \sin(52t)$$

# Higer Order Linear Constant Coefficient ODEs

The same approach applies. For an n<sup>th</sup> order equation, we obtain an n<sup>th</sup> degree polynomial.

Complex roots must appear in conjugate pairs (due to real coefficients) giving a pair of solutions e<sup>αx</sup> cos(βx) and e<sup>αx</sup> sin(βx) for each pair of complex roots.

It may require a computer algebra system to find the roots for a high degree polynomial.

# Higer Order Linear Constant Coefficient ODEs: Repeated roots.

- For an  $n^{th}$  degree polynomial, *m* may be a root of multiplicity *k* where  $1 \le k \le n$ .
- If a real root m is repeated k times, we get k linearly independent solutions

$$e^{mx}$$
,  $xe^{mx}$ ,  $x^2e^{mx}$ , ...,  $x^{k-1}e^{mx}$ 

or in conjugate pairs cases 2k solutions

$$e^{\alpha x}\cos(\beta x), e^{\alpha x}\sin(\beta x), xe^{\alpha x}\cos(\beta x), xe^{\alpha x}\sin(\beta x), \dots,$$
  
 $x^{k-1}e^{\alpha x}\cos(\beta x), x^{k-1}e^{\alpha x}\sin(\beta x)$

### Example

Find the general solution of the ODE.

$$y'''-3y''+3y'-y=0$$
The ODE is linear, homogeneous will constant coef.  
The Characteristic equation is  
 $m^{3}-3m^{2}+3m-1=0$   
 $(m-1)^{3}=0 \implies m=1$  triple root  
A fundamental solution set is  
 $y_{1}=e^{1x}$ ,  $y_{2}=xe^{1x}$ ,  $y_{3}=x^{2}e^{1x}$ 

<ロト <回 > < 回 > < 回 > < 回 > … 回

The general solution  $y = C_1 e^{x} + C_2 x e^{x} + C_3 x^2 e^{x}$ 

### Example

Find the general solution of the ODE.

$$y^{(4)} + 3y'' - 4y = 0$$
The 60c is linear, honoseneous, w) constant  
coet. The characteristic eqn is  

$$m^{4} + 3m^{2} - 4 = 0$$

$$(m^{2} + 4) \chi(m^{2} - 1) = 0$$

$$(m^{2} + 4) \chi(m^{2} - 1) = 0$$

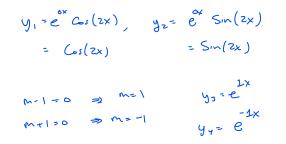

$$(m^{2} + 4) \chi(m^{2} - 1) = 0$$

$$m^{2} + 4 = 0 \implies m^{2} = -4 \implies m = \pm \sqrt{-4} = \pm 2i = 0 \pm 2i$$
Complex with  $q = 0$ ,  $\beta = 2$ 

$$(p + 4) = 2i = 2i = 0$$

$$(p + 4) = 2i = 2i = 0$$

$$(p + 4) = 2i = 2i = 0$$

The general solution  $y = C_1 (c_0(2x) + C_2 S_1(2x) + C_3 e^{X} + C_2 e^{X})$
