Logistic Differential Equation

The equation

$$\frac{dP}{dt} = kP(M-P), \quad k, M > 0$$

is called a logistic growth equation.

Solve this equation and show that for any initial population $P(0) \neq 0$, $P \rightarrow M$ as $t \rightarrow \infty$.

Bernoulli eqn $\frac{dy}{dx} + Q(x) y = f(x) y^n \qquad u = y^{1-n}$ Usdues $\frac{du}{dx} + (1-n) Q(x) u = (1-n) f(x)$ $\frac{dP}{dt} - k M P = -k P^2 \qquad n = 2$ September 3.2021 2/41 Let $u = P'^{-2} = P'$ Here, Q(t) = - kM, f(t) = - k and 1-n=-1 $\frac{du}{dt}$ + (-1) (- km) u = (-1) (-k) 50 du + kMu= k Qi(t)= kn = p= e = e = phMt $e^{kmt}\left(\frac{du}{dt}+knu\right)=ke^{kmt}$ - 3

Section 6: Linear Equations Theory and Terminology

Recall that an nth order linear IVP consists of an equation

$$a_n(x)\frac{d^n y}{dx^n} + a_{n-1}(x)\frac{d^{n-1} y}{dx^{n-1}} + \dots + a_1(x)\frac{dy}{dx} + a_0(x)y = g(x)$$

to solve subject to conditions

$$y(x_0) = y_0, \quad y'(x_0) = y_1, \quad \dots, \quad y^{(n-1)}(x_0) = y_{n-1}.$$

The problem is called **homogeneous** if $g(x) \equiv 0$. Otherwise it is called **nonhomogeneous**.

September 3, 2021 8/41

Theorem: Existence & Uniqueness

Theorem: If a_0, \ldots, a_n and g are continuous on an interval I, $a_n(x) \neq 0$ for each x in I, and x_0 is any point in I, then for any choice of constants y_0, \ldots, y_{n-1} , the IVP has a unique solution y(x) on I.

Put differently, we're guaranteed to have a solution exist, and it is the only one there is!

Homogeneous Equations

We'll consider the equation

$$a_n(x)\frac{d^ny}{dx^n} + a_{n-1}(x)\frac{d^{n-1}y}{dx^{n-1}} + \dots + a_1(x)\frac{dy}{dx} + a_0(x)y = 0$$

and assume that each a_i is continuous and a_n is never zero on the interval of interest.

Theorem: If y_1, y_2, \ldots, y_k are all solutions of this homogeneous equation on an interval *I*, then the *linear combination*

$$y(x) = c_1 y_1(x) + c_2 y_2(x) + \cdots + c_k y_k(x)$$

イロト 不得 トイヨト イヨト ヨー ろくの September 3, 2021

10/41

is also a solution on I for any choice of constants c_1, \ldots, c_k .

This is called the **principle of superposition**.

Corollaries

- (i) If y_1 solves the homogeneous equation, the any constant multiple $y = cy_1$ is also a solution.
- (ii) The solution y = 0 (called the trivial solution) is always a solution to a homogeneous equation.

Big Questions:

- Does an equation have any **nontrivial** solution(s), and
- since y₁ and cy₁ aren't truly different solutions, what criteria will be used to call solutions distinct?

Linear Dependence

Definition: A set of functions $f_1(x)$, $f_2(x)$, ..., $f_n(x)$ are said to be **linearly dependent** on an interval *I* if there exists a set of constants $c_1, c_2, ..., c_n$ with at least one of them being nonzero such that

$$c_1 f_1(x) + c_2 f_2(x) + \dots + c_n f_n(x) = 0$$
 for all x in I.

(1)

12/41

September 3, 2021

A set of functions that is not linearly dependent on *I* is said to be **linearly independent** on *I*.

NOTE: Taking all of the *c*'s to be zero will **always** satisfy equation (1). The set of functions is linearly **independent** if taking all of the *c*'s equal to zero is the **only** way to make the equation true.

Example: A linearly Independent Set

The functions $f_1(x) = \sin x$ and $f_2(x) = \cos x$ are linearly independent on $I = (-\infty, \infty)$.

Let's assume C, Sin X + C2 Cos X = O For all real or. This must be true if x=0. When X=0, the equation is $C_{1} \leq 0 + C_{2} c_{2} = 0$ September 3, 2021

This says
$$C_2 \cdot I = 0$$
 is $C_2 = 0$.
The equation is $C_1 \sin x = 0$ for all real x .
This must be true when $x = \frac{T}{2}$.
Ushen $x = \frac{T}{2}$, the equation is $C_1 \sin \frac{T}{2} = 0$.
That is, $C_1 \cdot I = 0$ i.e. $C_1 = 0$.
Use ve shown that
 $C_1 \sin x + C_2 \cos x = 0$ for all
real x and if $C_1 = C_2 = 0$. Hence
 $f_1(x) = \sin x$ and $f_2(x) = \cos x$ are
linearly independent.
